The ordinary source of rennet is the fourth or digestive stomach of the calf. Regarding its preparation we quote from Wing's "Milk and Its Products." The rennet skin should be obtained from an animal of some age. Still-born calves, or calves less than three days old, furnish a rennet of very inferior quality. The calf should be slaughtered three or four hours after it has had a full meal, and the fourth stomach carefully taken out. This should be emptied by turning inside out and any particles of foreign matter carefully picked off; it should not be washed with water. It should then be sprinkled with salt and stretched in such a manner that it will readily dry." Regarding the preparation of rennet extract this is entirely a commercial proposition. To make the commercial preparation with white wine, according to labels on commercial packages, involves the services of experts with proper equipment.

Overpasturing by Bees

Have from 100 to 150 colonies of bees. Last year a neighbor half a mile away brought in a lot of bees and since then mine have not done well. Is there a law to compel this man to move his bees?—Subscriber.

There are no legal steps which may be taken to prevent overpasturing by bees. "By right of discovery" does not hold with bee pastures, so that a newcomer may put in as many colonies as he wishes.

Water Delivery

I would like some information in regard to methods of delivering water to patrons of irrigation districts. There is an irrigation ditch running through my land but no gate or weir for taking out the water. The ditchman measures the water about a quarter of a mile away. Is this proper and what means have I of knowing whether I am getting the amount of water to which I am entitled? Would like to learn regarding the practice in other sections.—Subscriber.

This matter of water delivery is controlled entirely by local conditions

1842 The Seventy-Fifth Anniversary of 1917

P&O

LIGHT DRAFT PLOWS

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

P&O

Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Traction Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P&O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P.& O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

and the agreement originally made with the company or association. Often it is at the highest corner of each water-user's place, again it is at the nearest gate or ditch on the company's line. In your case if the company agreed to deliver at the highest corner of your land the upkeep of the ditch to your place would be entirely the company's affair. In the Imperial Valley and other sections the custom is for delivery to be made at the nearest company canal gate or "check." The upkeep of ditches away from this canal is entirely up to the water user.

Cutting Alfalfa

Mr. C. W. Brown of Tulare writes:

We have been cutting our hay for the dairy cows for a number of years with good results. We use a 16-inch ensilage cutter. Your Tulare subscriber who inquired as to cutting hay could call at the ranch, four miles north of Tulare, and investigate for himself.

Acid on Alkali Lands

Answering inquiry as to method of applying sulphuric acid to alkali lands, Manager S. P. Frizelle of the Kearney Vineyards writes:

"The amount was slightly in excess of one ton per acre. This was applied by attaching home made sprinklers to acid drums. The acid was shipped in tank car and was drawn off into the drums and applied directly to the land. The alkali content of the land was extremely high, being three and four per cent in the surface soil in some places. It was so bad that under the best conditions we were unable to get a stand of either barley or maize, in fact an abandoned field. The amount of acid applied was first determined by an analysis of the soil and acid enough to neutralize the amount of salt present was put on."

THE IMPERIAL ASSEMBLY

Continued from Page 217

ment of a hog cholera serum plant which is now supplying to members of the bureau about $200 worth of serum every month, and the cow testing association, or department, of the bureau with a membership of 4000 cows. This is the largest cow testing association in the world and employs four testers continually in the field. Then there was the live stock fair, another result of farm bureau effort, and now comes the greater ambition of this fair to own its own grounds. The last of the activities of the bureau is the formation of farm loan associations of which six have already been organized in the valley. With all these accomplishments many activities are planned for the future.

Dr. Elwood Mead, chairman of the commission on land colonization and rural credits, was listened to most intently in his talk on land colonization as it is conducted in some other countries and as he thinks it should be conducted in California. Too many farmers enter into contracts which with the abilities and capital at their command they can never complete. They must be educated to use their heads and their pencils more. To that end he hoped a bill presented to the present legislature empowering a commission to make an experiment somewhat along the lines of the land colonization work carried on in Australia, would pass. This would enable buying one or perhaps more tracts of land, to be investigated by experts of the state who would give information as to the crops it was qualified to raise. These experimental plats or farms to be sold to farmers of ability, yet of small capital. What these experiments might lead to Dr. Mead leaves to the future. It is to be hoped that the legislature will follow the recommendations of the commission.

The assembly was a credit to Walter E. Packard of the experiment station staff and president of the county farm bureau, who had the arranging of the program; also to C. F. Boarts, chairman of the committee on arrangements; to County Farm Adviser Dougherty; also to every other officer, director and member of the bureau.

Alpha Automatic High Pressure Power Sprayers

Drive the Solution into the Trees Under a Uniform Heavy Pressure

The satisfactory results obtained with either the Alpha Triplex or Alpha Duplex outfits are due primarily to the following unquestionable superior features of the Alpha Sprayers:

The Automatic Pressure Governor

which insures safety, secures uniform pressure, and eliminates unnecessary wear and strain on both pump and engine. No troublesome relief valves or diaphragm pressure regulators are required on Alpha Sprayers. No liquid is pumped except it is forced through the nozzles.

The Perfect Power Plant

The Alpha Gasoline and Distillate Engine which is directly geared to the pump is a thoroughly first class machine. Built to stand up under continuous full load. Equipped with built-in, gear-driven magneto. No batteries required. Starts on the magneto without cranking.

You can equip the power sprayer you now have with an up-to-date reliable Alpha Engine. Write us for Special Engine catalog.

The Alpha Re-filler; the Flexible Suction Pipe connection between Supply Tank and Pump; the sturdy steel frame construction and accessibility of Alpha Sprayers are details which would be decidedly to your interest to investigate before buying any spraying equipment.

For full particulars and name of nearest dealer. Write

Olive Trees

50,000 Mission and Manzanillo

The two best commercial varieties

Splendid, well-grown stock, perfectly clean of all insect pests, with a splendid fibrous root action, in prime condition to plant.

Olives are one of the coming and most important of all economic fruits grown in California. There is a constantly increasing demand for California Ripe Olives, to say nothing about the value of the crop for the production of oil. They require but little attention, compared to other fruits; they grow with a minimum amount of water. Hilly land unsuited for ordinary fruiting crops, will suit them perfectly, and can be made not only productive, but highly remunerative.

The stock we offer is A-1 in every respect. If you are in the market for a large or small quantity, you will find the prices more than attractive. If you have some vacant land and are wondering what to plant it with, it will pay you to investigate the prices we can quote you on these trees. Sample trees may be seen at our Sales Department at Ninth and Olive. We can furnish them in the following sizes:

½ to ⅝-inch caliper.
⅝ to ¾-inch caliper.
¾ to 1-inch caliper.
1 to 1¼-inch caliper and over.

If not convenient to call, write us or telephone.

IRON AGE

GARDEN TOOLS

Answer the farmer's big questions: How can I have a good garden with least expense? How can the wife have plenty of fresh vegetables for the home table with least labor?

IRON AGE Combined Hill and Drill Seeder

solves the garden labor problem. Takes the place of many tools—stored in small space. Sows, covers, cultivates, weeds, ridges, etc., better than old-time tools. A woman, boy or girl can push it and do a day's hand-work in 60 minutes. 33 combinations. $3.25 to $15.00. Write for booklet.

Highway Planting in California

Written for California Cultivator By E. Braunton

IN Eastern states where nature sleeps all winter and rains fall throughout the summer; where, east of the Missouri and Mississippi Rivers, no alkali is found, the highway tree problem is beset with fewer and lesser problems than in the Far West, where soils, climates, water supplies., etc. are at great variance and of great variety.

Here the problem is to take trees from any and all quarters of the earth and create, so far as we may, the special artificial conditions under which these trees will thrive and eventually pass from the necessity of care by man. It seldom happens that the rainfall is here excessive, though this may be true of low lands subject to flood and overflow. If so the excess water has to be drained off either in open ditches or underground conduits. In some cases soils are too heavy or impervious to water and must be dug deeply or blasted and some material introduced to keep them open. Sand, ashes, stable manure or other organic matter, or perhaps lime alone may be the proper material to overcome the deficiency.

Again the soil may be so light and porous, so deficient in organic matter that it not only lacks the plant food necessary to normal tree growth, but may fail to sufficiently retain soil moisture. This may necessitate the introduction of animal manures, composts, or perhaps heavy loam or clay in sufficient quantity to enable young trees to get started aright for the first few years. An excess of alkali may also require temporary treatment to serve as a neutralizing agent or demand permanent drainage.

It may also be necessary to give some special cultivation or preparation to ameliorate existing unfavorable conditions. Deep culture is generally desirable on any soil and often will free the surface from excess alkali, break up a shallow hardpan or too heavy subsoil, mix a rich subsoil with an impoverished or naturally poor surface soil, permit a drying out or sweetening of an acid or foul soil, as is often the case when stagnant water remains too long near the surface, and correct such a number of evils as to warrant the universal practice of turning up all soils as deeply as possible. There is herein indicated some of the bad conditions one may find even in a roadside stretch of a single mile, or all of them may be present in the same mile. It is hoped those who have the task of planting in hand will study well local conditions before an attempt is made to induce any one kind of tree to adapt itself to a great range of bad or unnatural conditions.

Watering Highway Trees

Where there are stretches of highway trees needing much summer watering, as in the case of dry and easily drained soils, the tank wagon method of irrigation is not the most economic. A continuous line of pipe would in the end prove cheapest and would give service even for a score or more of years and if required over a long term would necessitate but a portion of the expense incumbent upon hauling water.

A valve attachment could be placed at every tree, and portable gas engines are common in California. A water supply is generally available every mile or two and a 15-horsepower gas engine with a four-inch centrifugal pump will force water a distance of two miles. While such an initial outlay seems proportionately large, careful estimates of known examples have proven the cost of three years' service to be less than one-half that of hauling water in tanks if the trees receive the needed amount of water.

Backward Garden Season

For three months past the low temperature made a season of forced inactivity in the garden. In my own place plants put out three months ago are scarcely larger—and less vigorous—than when planted. At that time I planted four species of native lilies: pardalinum, Parryi, Humboldtii, and Washingtonianum. Not one of these has shown above the soil, though they are surrounded with a little pure sand, in a soil just worked over three feet deep, and therefore none have rotted. Everything else in plant life, nearly, has likewise stagnated. All this points to the fact that we may now plant all those same things we put in the soil three months ago and harvest flowers from the two lots at nearly the same time. A bed of cinerarias in my garden has scarcely developed any growth in three months, but among them some Primula Malacoides have blossomed abundantly. It is a winter gem.

Garden Season Is Now

It must be apparent to all that the season of active gardening is the present, and not, as in normal seasons, a month or two back. Last October I was advocating broadcasting seeds of a little orange daisy from South Africa by the interesting name of Dimorphotheca aurantiaca. I planted mine over three large beds of bulbs, and while the latter are up the daisy seeds rotted by reason of excessive and continued cold and sunless days. Seven other kinds of seeds of annuals suffered the same fate. Seeds of poppies alone survived the ordeal. I would therefore advocate the immediate sowing of spring and summer annuals at this time, for seeds of poppies of four kinds, sown in October are now but one-eighth inch high. Seeds sown now will produce flowers as soon as will the October sowing.

Propagate Bedding Plants

Now that real cold weather is past we are safe in propagating all sorts of bedding and herbaceous plants. A good box of sand in a protected, half shady place that is neither too hot nor too cold is the best location for it. In this box put cuttings of begonias, carnations, fuchsias, heliotropes, marguerites, salvias, and all sorts of lowly border plants. If one had a hot bed it would insure a far larger percentage of rooted cuttings, but even without bottom heat, if conditions are favorable and no bad weather conditions ensue, the treatment herein outlined will give a goodly lot of vigorous young plants for summer flowers.

Harmony With Native Plants

Aside from the peculiar climatic suitability of native plants for garden use comes in the matter of harmony with local landscapes. Our rounded hills and undulating mountain ranges with but minor crags and peaks, calls for softened rounded outline of tree top and bush top, and what can better supply the ideal form than plants native to California? Plants always appear most at home or in natural surroundings that most closely harmonize with the landscape both far and near. Do not place trees with spike-like tops where one may get above them and look down, or there may come the suggestion, not a pleasant one, that we might fall upon these bayonets and be injured. Keep points at extreme top points and rounded outlines below.

PROFIT comes from fruit, not foliage. On Citrus fruits use immediately available

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Unsigned communications receive no attention.

Promissory Note

A homesteader owes "A" $25 and gave "A" the following promissory note: "I, John Doe, mortgage one mare, color bay, also one spring wagon for the amount of $25. The above amount I agree to pay not later than April 5, 1917." Is this legal, or does it have to be drawn up before a justice of peace or a notary public? And if it is legal can "A" attach this mare and spring wagon and collect the money? As John Doe is a homesteader would this mare and wagon be exempted even if he has mortgaged it to "A".—Subscriber.

The contract as stated might possibly be valid as between the parties, but it is totally void as against creditors of the mortgagor, or subsequent purchasers or encumbrancers of the property attempted to be mortgaged, unless it is accompanied by affidavit of all the parties that it is made in good faith and without any design to hinder, delay or defraud creditors, and unless it is acknowledged and recorded in like manner as a deed. If you should take it before your justice of the peace he could undoubtedly improve greatly upon the form of the mortgage. If there is a valid chattel mortgage the homesteader cannot claim his exemption as against it.

Chickens Trespassing

I have a fruit orchard and raise potatoes, melons, corn, alfalfa, and vegetables between the rows of the trees. My neighbor across the road raises chickens and turkeys. He lets them run on my place, destroying my crops. I have asked him to keep them off, but he won't do it. My place is not fenced. What can I do to have him keep his chickens off my place?—Subscriber.

Your lands not being fenced, you cannot take advantage of the "Estray Act." However, you might bring an action for damages against the owner of the chickens for the loss caused. From a practical standpoint in some cases a number of chicken dinners have a very good effect.

To Terminate Life Estate

What procedure is it necessary to go through to terminate a life estate after the death of the person holding such interest?—Subscriber.

A verified petition must be filed in the superior court, setting forth the fact of the death of the party and the nature of the estate under which the land is held, by any person interested in the property. Thereupon, after such notice as the court may order, including service of copy of notice upon the state controller, the court hears the petition and the facts offered, and if upon such hearing it appears that the life estate of the deceased is absolutely terminated by reason of his death, or that an estate vested in any survivor, or in the case of a homestead in the survivor of the marriage, a decree is made to that effect. A certified copy of such decree is then recorded in the office of the county recorder, which vests complete title in the person to whom the estate survives.

Recording Expiration of Contract

In case a contract for a limited time is made with a real estate agent for the sale of property and the contract recorded, will it subsequently affect the title if some note of the expiration of the above contract is not recorded, or is this unnecessary, no sale having been made by agent?

It depends very largely upon the character and form of the contract. With some contracts it would necessitate an action to quiet title; others, probably not.

THE NITRATE SITUATION

In "The American Fertilizer" we note that the committee on public relations of the American Electrochemical society has submitted the following recommendations to the government relative to provisions for an ample supply of nitrates.

"It will take a considerable time to build a plant for fixation of atmospheric nitrogen using any of the known processes. Even on a war basis with all questions of cost sacrificed several months would be required. We therefore urge the necessity of providing at once 18 months' supply, on a war basis, of Chilean nitrate, using government ships if necessary, this reserve to be stored at various strategic points.

"As the government should have information regarding developments in each of the processes proposed to date, in order to be able to act in case of emergency, we add our endorsement to the recommendation that a committee of appointees by the president visit each of those groups of men who control these processes and have intimated their willingness to furnish proper representatives of the government with full confidential data.

"As we confidently hope that this country may never be involved in war, while thoroughly believing it should be prepared for immediate defense, it should be remembered that the great peace use of fixed nitrogen is as a plant food, and it is therefore desirable that private interests be allowed to develop the best and cheapest process on a peace basis without either government aid or government hindrance unless equally applied to all comers. We are therefore opposed to a government subsidy to any particular process at the present time because the relative merits of the several processes cannot yet be clearly seen."

HAD THE PROOF

An earnest preacher in Georgia, who has a custom of telling the Lord all the news in his prayers, recently began a petition for help against the progress of wickedness in his town, with the statement:

"Oh, Thou great Jehovah, crime is on the increase. It is becoming more prevalent daily. I can prove it to you by statistics."

There Are Dollars In Your Subsoil. Get Them Out!

The value of your land can be greatly increased by means of subsoiling.

Beneath the surface soil of your fields, which has been thoroughly stirred by your plow and kept fertile by the rotation of crops, there lies a subsoil that you have never touched.

This subsoil is probably either one of two things—rich soil of which you should be getting the benefit, or a hardpan which is obstructing drainage, deforming the roots of plants and trees, and in other ways lessening the value of your land. In either case it should be broken up by means of

HERCULES DYNAMITE

If the underlying soil is fertile and rich so much the better. Subsoiling with Hercules Dynamite will stir it up, bring part of it to the surface where it will be at the disposal of your crops, loosen it so that the roots can penetrate it easily and get out of it all the good there is in it.

On the other hand, if the subsoil be a hard, impervious layer beneath the cultivated soil it is imperative that it be broken up in order to facilitate drainage, give roots a chance to spread naturally, and get out of it the mineral food it contains.

By means of subsoiling the yield of thousands of acres in this country has been increased anywhere from 10% to 200%, depending on the crop and local conditions. Soil that has been utterly unproductive has been made fertile.

If you have not looked into this question you should. As a first step write for our book, "Progressive Cultivation". It will be sent free on request. It not only discusses in detail the matter of subsoiling with dynamite but also tree planting, irrigation, drainage work, rock and stump blasting, etc.

You will find it worth reading. Send for your copy today. Please use the coupon below.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

This week's cover is rather different. Readers may note that the advertiser is rather encroaching upon our space, and to save a bit of that which is so valuable these days of high cost of paper, we talk about and illustrate the Imperial Valley Farm Bureau Assembly and give a view of one of the Brawley cotton gins and the stack of cotton which is piled around it. The Valley is producing some 60,000 bales this year and talks as if she would like to produce twice that number another year. In any case the industry is growing. The Imperial Valley? Yes, it is growing too.

SHOP EARLY

The railroads are appealing to farmers who contemplate using implements, fertilizers or other supplies in the near future to place orders at once. The shortage in transportation facilities daily becomes more acute. It will mean great loss to the farmer whose work must be finished in season not to have supplies. His needs should be anticipated by weeks, if possible, by months.

GARDEN

A number of articles are appearing in the household department which we believe it would be well for every reader of the Cultivator to peruse. They have to do with the kitchen garden. We were recently in the Imperial Valley and saw several gardens which have not only added much to the variety and attractiveness of the daily menu but also to the comfort of the family in cash returns from sales of fresh vegetables to other families in the neighborhood who did not believe in gardening. "Because of the war" even vegetables have gone up in price. Let's grow our own. Only one of these articles appears in this issue. Others next week.

NEW BEAN CONTRACT

Lima Bean growers of Ventura County are securing action in the signing up of contracts for next year. The new contract is so written as to protect the association as well as the grower. Under this contract the grower will pay the association two cents per pound for all uncleaned beans or seed beans he fails to deliver to the association. The best of it is that the new contract is being almost unanimously endorsed.

ORANGE SHOW ON

The National Orange Show is now on at San Bernardino and will be till the end of the month. The splendid displays of previous years are bringing even greater crowds of attendants this year in spite of the damp weather, for such weather cannot dampen the enthusiasm of citrus lovers of California. This show is staged as a splendid spectacle; it is also an educational feature which everyone who possibly can should visit.

A TRIBUTE

ANSWERING a request of the editor for a word of appreciation as to the work which Arnold V. Stubenrauch did, which will benefit California and all America, Dean Thomas Forsyth Hunt of the College of Agriculture, University of California writes:

"Your kind favor relative to the death of Professor Arnold V. Stubenrauch has been received. The shock has been so great and the personal loss is so keenly felt that it does not seem possible at this time to write at length of his contributions to horticulture.

"His loss to the state and to the university is irreparable. He was the accepted leader among college men in the field of transportation and marketing. He was a most simple and sincere man, never by word or deed drawing attention to himself personally. He could always be depended upon to take the sound view. He was not only fundamentally trained in the technique of his subject, but he grasped its larger aspects as few men do. The word 'lovable' was commonly used in referring to him, which accounts for the fact that he was a leader of men both young and old."

FARMERS PROTECTIVE LEAGUE

Since the first eight hour campaign in California the Farmers Protective League has been true to name. Its greater activities have been in the northern part of the state, though it has had affiliating organizations in the southern end. Now, however, a definite effort is being made to organize the southern end of the state as well. President McKevitt has had a conference with producers at Los Angeles, and C. C. Teague has been made chairman of the organization committee to work up a live and energetic membership in the South.

The farmers need such an organization to have oversight of legislative and other matters affecting producing interests.

GRAFTING

When we recently asked Mr. Roeding to give us the latest in methods of grafting, he referred to an article which he wrote for California Cultivator readers a couple of years ago and said that it, with a few revisions, would be as good as he could give to us. These revisions he has made, and the article appears in this issue.

We wish to repeat one remark Mr. Roeding made when we suggested that we wished instructions so plain that the veriest novice could graft over his trees. He said: "You must bear in mind that success is in the man and not in the method nor the tool," which sounds very much like some of the advice given for years in the columns of the Cultivator. It's the "man behind" and the energy and intelligence which he puts into his job that counts. If one wishes to graft over an orchard the first thing necessary is thorough mastery of the principles and then the best of practice.

ORANGE DAY

Orange Day is March 10.

When the celebration of Orange Day was first suggested, Los Angeles, in the center of a section which receives much benefit from this industry, with its usual enterprise got busy and organized an Orange Day committee. We believe there was no idea of excluding other sections; on the contrary the purpose was to inspire all sections to observation of the day and to secure the cooperation of all who would aid in this movement. Correspondence has been taken up with all sections of the United States. Some papers in the Northern California citrus sections have referred to the fact that there is a bit of restiveness in the northern sections because there are no northern men on this committee.

There is no reason whatever why Northern and Central California, and, in fact, Florida, might not most profitably use every effort to secure not only a national, but an international, observation of this day. The idea is to eat oranges, to drink oranges, to use orange and lemon juice in the bath and as a medicine. Without question, Florida last year received great benefit from the efforts of California orange growers; she certainly will this year.

There is no reason why all should not unite in one grand boost.

RAINING AGAIN

California's best year seems to be upon us. The rains began early and have continued with fair regularity. As we go to press a glorious soaker is coming down which is reaching all over the state.

The world is crying for food. Actual starvation is facing millions. There is a great duty before all America. Its $13,500,000,000 produced agriculturally signifies large prices rather than large quantity. The quantity must be increased.

Internationally our own affairs are somewhat involved, but one of the greatest protective measures is the securing of ample food supplies. Europe is proving this today. Let California do all in its power.

Along this line, do you know that there are 6,000,000 less cows in the United States than there were five years ago and that there are 24,000,000 more people? This affects not only the food but the apparel problem.

Take every possible advantage of these timely rains.

North of the California boundary the rains have not been so plentiful and the Sacramento and San Joaquin Valleys could accommodate slightly more. The present storm seems more of a southern one. Los Angeles receiving 1.79 inches, Riverside, Redlands, and other similar sections 1.5 to 1.75 inches, Fresno about a half inch, with Sacramento Valley points about the same.

A New, Better and More Satisfactory
Mail Order Service

For Everyone Out of Town Who Wants a More Livable, BETTER Furnished Home!

We maintain a Personal Service Shopping Bureau especially for the benefit of our out-of-town customers. Every order is given the same attention by our expert shoppers who buy FOR YOU, as though they were buying for themselves. They seek the very best values in our stock FOR YOU. They take advantage of the very best BARGAINS. They give your instructions the greatest possible care.

Write for what you want. We send, in many cases, for your inspection, actual photographs of furniture upon our floors, which we believe will best meet your preferences. We quote you prices of the very best values in our stock. We enable you to secure the very newest products of the very best factories, and at lowest possible cost.

We send drapery samples, wall paper samples, etc. Tell us as nearly as you can what you wish and we will make special effort to meet your demands.

We pay the freight 100 miles and part of the freight for greater distances. Careful packing, prompt shipments.

All goods GUARANTEED ABSOLUTELY AS REPRESENTED, and SATISFACTION ASSURED. Write us. Address MAIL ORDER DEPT.

IS YOUR SOIL 100 PER CENT EFFICIENT?

Few Ranchers Realize Full Possibilities of Their Land

It is an astonishing fact that the great majority of California ranchers and fruit growers are suffering a very serious loss every year, of which they have little or no knowledge. That is, their crops do not begin to measure up to the maximum possibilities of their lands. This is a condition which would not be tolerated in any other line of business, and there is no good reason why it should be endured in farming—the greatest business in the world.

If you do not get a full crop from your fruit orchard, your alfalfa land or grain field, it is probable that the principal fault is in the soil itself.

It is impossible to tell from the looks of a soil whether it is in perfect condition, and soil experts are, of course, expensive.

Every rancher will learn with interest, therefore, that a little device has been perfected which will test soil accurately, and show just what is needed to bring it up to the maximum of bearing efficiency. The initial cost of this little machine is very nominal, considering its great value to the rancher in increased crops. Once the device is obtained, the cost of each soil test is only a few cents.

These soil testers are being distributed on the Pacific Coast by Mr. Clement B. Stern, 612 Central Mortgage Bldg., San Diego, California, who will be glad to mail literature and full information regarding them to any reader of this paper who will simply drop him a line.

Agricultural News Notes of the Pacific Coast

Northern California

Sacramento is to have a union stock yard.

The farm adviser movement is arousing much interest in Butte County.

Entries for the California Jersey Breeders' Futurity stake will close March 1.

Considerable quantities of low priced rice are being fed to stock with excellent results.

The Arbuckle chamber of commerce has fixed September 13 and 14 as dates for the 1917 fair.

Shipments of the Colfax Fruit Growers' Association through 1916 were double those of 1915.

The Western Berkshire Congress convene at the university farm at Davis February 13-15.

It is estimated that 100,000 acres will be planted to rice in the Sacramento Valley this year.

The next meeting of the Jersey Breeder ' Cattle Club will be held at the university farm at Davis April 13.

Ten carloads of oil were received in the Durham district last week to be used in smudging in the almond orchards.

The Capay Ranch northeast of the Orland project will soon be thrown open to settlers. The ranch contains 9000 acres.

Napa County farm bureau members are planning for this year's county fair, which will be held the week following the state fair.

One of the features of the third annual Butte County Spring Exposition will be a milking contest. The exposition will be held some time in May.

There is reported to be an egg war on, directed against the new association of poultry producers of Central California. A former large buyer of eggs is said to have notified members of the new association that he will purchase no more eggs from them unless they withdraw from the association.

Central California

A number of Calimyrna fig growers of Merced are forming a pooling association.

The Dinuba Grape Growers' Association shipped out 30,717 crates of Malaga grapes last season.

Voters of the Turlock district will vote on $65,000 bonds for building a new high school on March 3.

Japanese vineyard workers of Fresno have returned to work on a schedule of $2.50 for a nine hour day.

A farmer of French Camp secured a jail sentence of one day against a man who shot his gopher-hunting cat.

There are reports that a new sugar factory is to be erected near Stockton in time for the next summer's run.

As an outcome of the fig institute held recently in Fresno an effort is being made to pool this year's fig crop.

The Dallas reservoir of the Modesto Irrigation District, which has been out of use for two years, is now being filled.

County Horticultural Commissioner Harry Ladd of San Joaquin states that the heaviest planting of orchard trees is of prunes.

Construction work on the Terra Bella Irrigation Project is in full swing. Pipe layers at the southern end of the district are laying 3000 feet of pipe per day.

The executive committee of the Fresno County Raisin Festival Association is holding many meetings these days and making many plans for the success of Raisin Day April 30.

The Dairymen's Cooperative Creamery Association of Tulare has elected Allen Thompson, president; W. J. Higdon, secretary. J. P. Murphy has been named manager for another year.

A new butter selling agency has been established in Los Angeles by the Danish Creamery of Fresno, the Riverdale Cooperative Creamery and the Dairymen's Cooperative Creamery of Tulare. The new combination expects to furnish one-fourth of Los Angeles' butter supply.

Southern California

Hueneme is to have a canning factory.

The Yucaipa Apple Association has 125 members, whose acreage totals 2000.

There is a report that Covina will soon secure the location of a citrus by-products manufacturing plant.

A farm survey of the Hemet district is to be made this spring by the United States department of agriculture.

The Orange County Harbor Commission recommends the construction of a channel 700 feet wide and 40 feet deep from the entrance of the harbor to Newport.

To attendants at the National Orange Show all railroads in Arizona, Nevada and California are offering fare and a third rates to San Bernardino next week.

Ranchers of the Imperial Valley are urged to plant more alfalfa another year as the demand, especially from cattle men of Arizona and New Mexico has sent prices sky high.

At the last monthly meeting of the directors of the Beaumont Fruit Growers' Association a profit for the year of $1076 was reported. Apples in cold storage yet unsold amount to 1200 boxes.

State Highway Commissioner Darlington has informed the supervisors of Ventura County that funds are now available for construction of the highway between Ventura and Montalvo bridge, which will close the last gap in the state highway.

The Yucaipa Apple Association is making plans for its next apple show. It has elected the following directors: L. P. Black, P. B. Hasbrouck, C. W. Partin, B. N. Boggess, A. A. Adams, George W. Taylor, Frank Dillion, C. H. Smith and K. B. Ward.

Vegetable and fruit growers of Riverside organized an association at Riverside on February 3. The object of the association is to encourage plantings of fruits and vegetables which will find readiest market and to look after the marketing end of the business.

The Coast

Seattle reports sales of Yakima Gem potatoes at $65 a ton.

Cold storage holdings of apples are 40 per cent less than last year at this time.

Omak, Washington, reports shipping out 200 more carloads of fruit than last year.

Cranberry growers of the lower Columbia have organized a marketing association.

Washington corn took the sweepstake award at the St. Paul, Minnesota, corn show.

An effort is being made at North Yakima, Washington, to sign up 10,000 acres for sugar beet planting.

The new stock raising homestead law permits the entry of 640 acres of non-irrigable, non-timbered land.

The Colorado State Dairymen's Association held its annual meeting recently at Fort Collins during the sessions of the Colorado Farmers' Congress.

Dairymen who recently formed an association to purchase lands at Richland, Washington, for raising their own feed are now planting 300 acres to alfalfa.

At the recent annual of the National Wool Growers' at Salt Lake City F. J. Hogenbarth of Salt Lake City was reelected president and S. W. McClure of Salt Lake, secretary.

A new by-products plant has been established at Wenatchee by representatives of the Northwestern Fruit Exchange. Evaporated fruits, jelly, cider and vinegar will be handled.

Colorado fruit growers have organized an association, electing Herbert Chase of Delta president and Dr. E. T. Sandsten of the agricultural college at Fort Collins, secretary-treasurer.

Farmers living along the Columbia River in Wahkiakum, Washington, are cooperating in building dikes, by which they expect to redeem 3000 acres of rich land from river overflow.

When writing advertisers, mention The Cultivator.

Economical Feeding of Hogs

AT present prices it is comparatively easy to devise a ration for hogs which leaves a margin for profit, but the margin may be widened with reasonable care. Some time ago we wrote Mr. R. K. Walker of the Fontana Land Company as to producing at home as much feed as possible and as to what methods he would advise —this with especial reference to green forage crops which might be grown either summer or winter. For the winter feeding note that he recommends and storing in a cool well ventilated place. These are both great worm preventives and splendid succulent feeds.

"For winter roughage, I know of nothing better than well cured alfalfa. This may either be ground into a meal, or if no grinder is available may be fed as hay in racks. Many farmers say hogs won't eat alfalfa hay. They will however if it is cured right, and this is how to cure it: Cut young before there are any blooms or buds and cure thoroughly in the cock. Cure until it

CHAMPION JUNIOR FOUR-YEAR-OLD

A great Holstein performance is that of Queen Piebe Mercedes 154610 owned by E. C. Schroeder of Minnesota. The figures of her world's record as a junior four-year-old are 30,230.2 pounds of milk and 1111.56 pounds of fat, equivalent to 1389.45 pounds of 80 per cent butter in 36 days. In no month of the year did she fall below 2000 pounds milk or below 100 pounds butter. Her average fat test for the whole year was 3.6 per cent. Besides holding the world records for both milk and butter in the junior-four class, she is the only heifer in the world with 30,000 pounds milk to her credit.

citrons, pumpkins and like crops. It will soon be time for planting these, and before the evenings shorten too much it may be well to look over opportunities for such planting for this season. Mr. Walker says:

"It has been my experience that none of the so-called nitrogenous forage crops produce well north of the Tehachapi. (In the Imperial Valley of course they have alfalfa almost the year around). The best succulent feeds for winter feeding are obtained by growing citrons or pumpkins in the summer and holding them over for winter feeding. This can be done by handling them so as not to bruise them will not go through the sweat whe stacked. This makes brittle instead tough hay, and the hog can handle very nicely and will eat it with relis

"Don't make the mistake of tryir to get all their protein from roughage I believe there has been too much e phasis placed on the protein conte of grasses. Add a little tankage (fi or ten per cent) of the grain ratio There is far too much fiber in a roughage for the protein it contain We can't expect to raise good chea pork without grasses, and the nitr genous ones are the best, but the ma protein supply will have to come in concentrated form, such as tankage.

Feed for Calves

MILK is so expensive nowadays that the farmer can't afford to pamper his calves on such a luxury. So the University of California has been experimenting for the past two years to find out the best way of raising strong and healthy calves on separator skim milk, mixed grain feeds and hay. The successful results are told by F. W. Woll, professor of animal nutrition, and E. C. Voorhies, instructor in animal husbandry in the University of California, in a bulletin on "Feeding Dairy Calves in California" which may be obtained free by writing College of Agriculture, Berkeley.

They recommend that the new-born calf be left with its mother for a day only (unless the cow's udder is greatly inflamed or the calf very weak) that the calf be fed whole milk for about two weeks, at first three times a day, later twice a day; and then gradually changed to warm skim milk, in the course of a week or ten days, since skim milk costs only about one-eighth as much as whole milk. When the calf is put on a skim milk diet it should receive a small amount of a grain mixture, gradually increased from less than a quarter of a pound daily to about two pounds at weaning time, four or five months of ag Bright, fine alfalfa hay or grain h should be kept before the calves, well as clean drinking water and sa The grain mixture can be made from standard dairy feeds, such rolled barley, dry beet pulp, mi kafir, cocoanut meal, crushed car pods, etc., according to the spec feeds available or economical. In t case of more or less delicate calv that do not eat their feed readily, small proportion of linseed meal m be included in the grain mixture.

Linseed meal is not necessary, a

Famous Blackhawk Shires

AGAIN demonstrated their superiority by their winnings at the 1916 California State Fair.

At this fair Blackhawk Shires won all first prizes except two, and in one of those classes had no entry.

A mare bred and developed at Blackhawk Ranch won Grand Championship over imported mares of the first quality, thus demonstrating the quality of stock we are breeding right here at home.

Anwick Arthur and his get again won the California Stallion Registration Board Special, for stallion and three of his get, over all breeds.

Do not Forget that Blackhawk Shires Won 68 Prizes at the Great Exposition Show at San Francisco in 1915.

If you need a first class Shire stallion or mare we can please you from a wide selection that have weight, quality and right draft type.

Our Shires are bred and raised under good healthy breeding conditions—they are not pampered—and we deliver to you horses in breeding condition that will breed, and at a price well within their value. Correspondence invited. Visitors welcome.

BLACK LEG LOSSES SURELY PREVENTED by CUTTER'S BLACKLEG PILLS

Low-priced, fresh, reliable; preferred by western stockmen, because they protect where other vaccines fail.

Write for booklet and testimonials.
10-dose pkg. Blackleg Pills, $1.00
50-dose pkg. Blackleg Pills, $4.00

Use any injector, but Cutter's simplest and strongest. The superiority of Cutter products is due to over 15 years of specializing in VACCINES AND SERUMS ONLY. INSIST ON CUTTER'S. If unobtainable, order direct.

The Cutter Laboratory, Berkeley, California

does not produce better gains than grain mixtures which omit linseed meal, but linseed meal makes the mixtures more palatable and to some extent improves the calves' appearance and handling quality. It is not necessary, therefore, to make this usually high priced feed a part of the grain ration for thrifty calves that have been successfully brought over to a skim milk diet.

The university farm proved that calves can readily be brought up to a weight of over 450 pounds at an age of six months on a ration of skim milk, alfalfa hay and a suitable grain mixture, at a feed cost of a little over four cents per pound of gain in body weight from the time the calves are put on skim milk.

A mixture of beet pulp and barley, fed with skim milk and alfalfa hay, was found to have a nutritive value about ten per cent higher than that of cocoanut meal fed in similar amounts and combinations. The dried beet pulp is generally cheaper than cocoanut meal. A good mixture is two parts of rolled barley to one each of beet pulp and cocoanut meal.

As an essential suggestion in the successful building up of a dairy herd, Professor Woll and Mr. Voorhies urge that farmers raise heifer calves only from the good cows in their herds. They point out that no farmer can expect to make a real success of dairying unless he places at the head of the herd the best pure bred dairy bull that he can secure. "The bull is half the herd," says the proverb, and they declare that a good bull who will transmit to his offspring the capacity for large dairy production bred into his line for many generations back is likely to be worth all that he costs and much more.

WESTERN DAIRY PRODUCTS SHOW AND CONVENTION

In connection with the Western Dairy Products Show to be held in Portland, Oregon, March 1 there will be program of addresses on dairying problems before a convention of the Western Dairy Instructors' Association. Discussion of addresses will be an important feature.

Subjects to be considered are; Sterilization and Care of Utensils, Pasteurization of Market Milk, Inspection of Market Milk, Standardization of Cheese, Pasteurization for Buttermaking; Neutralization of Cream; Butter Standardization, Needed Oleo Legislation.

There will be exhibits of butter, cheese, milk and cream. The object of the show is to assist in establishing a uniform standard of excellence for these dairy products, to improve their quality and thereby increase their consumption and to afford proper recognition and encouragement to the producer of high class products. It is hoped through it to bring the producers of dairy products into closer relation with each other and with the dairy instructors, to the benefit of all concerned. In fact the show is intended to fill a place here in the West similar to that filled by the great shows held in the East.

JERSEY CATTLE CLUB

We have letter from Richard H. Daniels, president of the Jersey Cattle Club of Bitter Root Valley, Montana, in which he refers to the good work being done by the Bitter Root Valley Jersey Breeders' Association. This is a comparatively recent organization, organized to encourage the breeding of Jerseys and especially the improvement of dairies in that section of Montana. To that end pure bred Jerseys will be brought in from other sections and dairymen will be urged to join their neighbors in the purchasing of pure bred bulls. Cow testing associations will also be organized and feed will be purchased in carlots. The officers are Richard H. Daniels, president; Robert H. Marks, vice president, and Ben F. Plummer of Stevensville, secretary.

D. O. Lively Stock Farm, Inc., announces the purchase of the registered Herefords from the Whitehall Estates, at Tracy. There are 67 head of these cattle, and Lively, who knows cattle, says that there are animals in the lot that are the equal of the best in the United States. A public sale of Herefords will be held at the D. O. Lively Stock Farm on May 2, due announcement of which will appear in the advertising columns of this paper. Mr. Lively is now in the Middle West selecting a herd for the grand lot of females that make up this herd. He has purchased a great young Hereford bull of the Warren McCray herd.

Choice Holsteins

Well Bred—Good Individuals

will be found in the Dispersal Sale of Lakeside Dairy Herd owned by H. I. Shaw, Lakeside, California

22 REGISTERED HOLSTEIN-FRIESIAN COWS AND HEIFERS
2 REGISTERED HOLSTEIN-FRIESIAN BULLS
27 HIGH GRADE HOLSTEIN COWS AND HEIFERS

Among the registered females are seven daughters of a 32-pound sire, and that is not all. He is by Pietertje Hengerveld Segis, 66 A.R.O. daughters, a son of King Segis, and his dam is a 32.45-pound daughter of Hengerveld De Kol, 116 A.R.O. daughters. Then there are five daughters of Captain Julip Zampa, 9 A.R.O. daughters; two daughters of Arcady Pontiac Wayne Hengerveld, 24 A.R.O. daughters with records up to 28.08 pounds; a daughter of Juliana King of Riverside, and out of a 26.56-pound dam. These are good enough for any man's money.

The two herd sires to be sold are worthy of especial attention. One is a son of King Prilly Segis, whose sire is King Segis, and whose dam is the famous Prilly. His dam is a well bred cow carrying largely the blood of the great Sadie Vale Concordia. The other is strong in the blood of Colantha Johanna Lad on the sire's side and is out of a dam whose sire is a son of De Kol 2nd's Butter Boy 3d and Belle Korndyke, one of the greatest transmitting cows of the breed.

You can make no mistake buying this kind.

DAIRYMEN: We will also sell on the same date, Mr. Shaw's entire herd of high grade Holstein cows and heifers, numbering 27 head. They are a choice lot of the profitable producing kind, well marked, and a sound healthy lot.

Sale will be held on the Thum Ranch, one half mile east of Lakeside, twenty miles east of San Diego, California, on Thursday, March 15, at 10 o'clock a. m. Lunch will be served at noon.

SALE AT BERKSHIRE CONGRESS

Continued from Page 219

M. Smith, Visalia, secretary-treasurer.

The next congress meeting will be the show held at Salem, Oregon, the last week in September, 1917. This show will be largely attended by breeders from all over the West.

At the Davis meeting there were no speeches, no papers read, no set program, just a real good fellowship, get-together affair that everyone enjoyed.

In the students judging contest nearly 200 students judged four different classes. Winners of first in each class were awarded Berkshire watch fobs by L. E. Frost of the Berkshire World.

The ladies' judging contest was the sensation of the meeting. L. E. Frost conducted the contest and awarded the 14 $50 silver trophies. He pronounced the winners to be judges of exceptional merit. "It was positively uncanny the way some of those ladies knew the best hog and how well they could tell it," he said.

Following are the winners: California National Bank trophy, Mrs. L. B. Landsborough; Grape Wild Farms trophy, Mrs. W. P. Dwyer; Sacramento Bee trophy, Mrs. H. F. Hammond; Butte City Ranch trophy, Mrs. G. M. York; Silver Birch Farms trophy, Mrs. C. E. Barrows; First National Bank of Willows trophy, Mrs. Gordon H. True; Gossard Corset Company trophy, Mabel D. White; Gossard Farms trophy, Miss D. Fritz; D. C. Burn trophy, Mrs. C. A. Briggs; Berkshire World trophy, Mrs. Flora C. Hayes; Mills Orchard Corporation trophy, Mrs. Homer Hewins; Travelers Hotel trophy, Mrs. Marion Poundstone.

A BLUE RIBBON TIME

Written for California Cultivator
By C. A. Briggs

BERKSHIRE swine breeders with their wives and friends met at the university farm at Davis on Tuesday, Wednesday and Thursday of last week. The occasion was the regular meeting of the Western Berkshire Congress with a sale of probably the finest specimens of Berkshires ever offered at auction in the West. The meeting and the sale were successful. Everybody had a good time. Dean Hunt and Dean Van Norman welcomed those attending, and the student body as one man "did things" to everyone attending in a way that made every one happy. Berkshire men were there from many points in the corn belt of the Middle West, from all the coast states and from far distant Hawaii.

The program was unique, and interesting, many new "stunts" being introduced. The university farm students judged hogs and the wives, daughters and women friends of the breeders contested in the judging ring for beautiful engraved silver trophies. Leading breeders of other breeds were present to add their token of good will.

At the sale the bidding was brisk and competition keen. Hogs sold, going to points as widely separated as Indianapolis and Honolulu. Prices ranged high, which was not surprising when the high quality of the offerings is considered.

The Berkshire men are to be complimented on their ability to bring to a successful conclusion such an enjoyable and helpful occasion as this meeting and sale.

UNIVERSITY EXTENSION IN CALIFORNIA

The report of the extension division of the University of California is being mailed and gives detailed account of the various activities of that department of the university. It appears that this division received in direct appropriation $20,000, and also receives from fees $29,400 biennially. In a prefatory note it is stated that the university of Wisconsin spent on university extension $239,110 and Minnesota, which has recently taken up university extension work, spends $89,350. This is a valuable work and "carries the college to the people."

The latest and newest of the breed papers to be reviewed is "The Shorthorn in America", a monthly magazine filled with illustrations and text of value to Shorthorn people. It is published by the American Shorthorn Breeders' Association, 13 Dexter Park Avenue, Chicago.

Prepare for Spring Calving

By Ordering

HOOD FARM BREEDING POWDER

In order that you may treat every cow after calving with this Powder. It is the most economical thing you can do, because it keeps cows in a normal, healthy breeding condition; makes them clean quickly; breed readily; there is less use of the bull, and little danger from abortion. You should also order

JERMKIL

to prevent and check infectious diarrhoea and white scours in young calves.

For ordinary scours caused by indigestion, order

HOOD FARM CALF SCOUR TREATMENT

consisting of Hood Farm Calf Scour Remedy and Hood Farm Digestive Powder. Include in the order

HOOD FARM MILK FEVER OUTFIT

and

HOOD FARM GARGET REMEDY

and you will be well prepared to meet the emergencies which frequently arise at calving time.

Prices, information and advice gladly given. Mention this paper.

C. I. HOOD CO., Lowell, Mass.

Purebred Registered

HOLSTEIN CATTLE

The scope of its labors and the numerous details involved in the administration of the affairs of the Holstein-Friesian Association are best comprehended by a consideration of the fact that, during the fiscal year ending April 30, 1916, $158,994.50 was received by the secretary's office for the registration of pedigrees and for transfers. This volume of business required 46,760 entries in the cash books, and the issuance of 142,120 certificates, and this prodigious labor is demanded for the conduct of but one department of the greatest dairy cattle breeders' association in the world.

Blacklegoids

NO DOSE TO MEASURE.
NO LIQUID TO SPILL.
NO STRING TO ROT.

BLACKLEGOIDS are small pills. Each pill is an accurate dose of blackleg vaccine.

BLACKLEGOIDS are easily administered—simply inject them under the skin with a vaccine injector.

TAKE NO CHANCES.

Don't wait until your calves become infected. This means certain loss—there is no *cure* for blackleg. Vaccinate now—before the deadly disease shows itself.

THE COST IS SMALL.

BLACKLEGOIDS are economical. The expense is trifling compared with the loss you are liable to sustain if you do not use them.

ORDER THROUGH YOUR VETERINARIAN OR DRUGGIST.

Write for free booklets on Blackleg, with full information about Blacklegoids.

Raise Your Calves on

Blatchford's Calf Meal

and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.
Prevents scouring and insures the early maturity of sleek, handsome calves.
It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or
Blatchford Calf Meal Factory, Dept. 5 Waukegan, Ill.

Unsigned communications receive no attention.

Poison

I have lost six fine, fat calves just ready to wean and wish some advice regarding the trouble. They were fed on skim milk and alfalfa hay and seemed to thrive splendidly up to the time of taking sick. Sometimes they last only a few hours and sometimes a day or two. They refuse to eat or eat reluctantly and act like a locoed horse, going round and round in a circle sometimes until they fall. There is no diarhoea and little signs of constipation. In the stomach I find a hard curd and am sending some of it under separate cover. Have kept the calves in a pen made of redwood boards and notice they have chewed the boards a great deal. Thought maybe the redwood formed a poison with the milk. Can you suggest a preventive or cure? —Subscriber, Lancaster.

The sample of the contents of the stomach that you sent is natural, being only the coagulated milk after being acted on by the gastric juices of the stomach. Am inclined to think it poison of some kind, maybe from the redwood. This I do not know. Can only suggest that they be tied so they can not chew the redwood and watch other conditions.

Sick Sow

What is wrong with a brood sow that is perfectly healthy and a hearty eater while carrying her pigs and then about five or eight days after farrowing will suddenly stop eating and lie around for several days or more with no inclination to eat or drink, after which she begins to recover by eating a little each day until gaining a good appetite again, but is lame in one hind leg or hip which seems drawn and somewhat shrunken.—Subscriber, Gardena.

The symptoms are very much like those in the horse when having azoturia. That disease is not well understood yet. It seldom occurs in animals unless they are very fat and have had very little exercise. Feed her sloppy and laxative feed and keep her in the sunshine as much as possible. Also get these powders; half an ounce of salicylate of soda, one ounce of bicarbonate of soda and two ounces of farina. Mix and divide into 20 powders, giving one in the feed morning and evening.

HOGS

Smith's Poland-Chinas—Sows and gilts bred to Joker, first prize boar at Wisconsin State Fair 1915. These sows and gilts were sired by Iowa Wonder, who is a son of the great A Wonder, the most celebrated Poland-China boar living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low, quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow, also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Send for Free Catalog—Finest ever issued. Tells of the famous Whitten Ranch money making strain of Big Type Poland-Chinas. Make greatest weight in shortest time at lowest cost, topping market at 225 lbs. in 6 months. 600 head, both sexes, all ages, reasonable prices. Satisfaction guaranteed. Ranch in Tulare County, but address owner, R. H. Whitten, 610B Security Bldg., Los Angeles.

Billiken Herd of Chester Whites—The big prize winners at the 1916 California state fair. The breed that makes money for the rancher and dairyman. Have 4 nice young service boars left and 20 young open gilts that will be bred as desired by buyer. Write for the Chester White booklet that tells all about them. C. B. Cunningham, Mills, Cal.

Poland-Chinas—Twenty good gilts and three 2-year-old sows for sale. Either sired by or bred to I. B. A. Wonder, reserve champion at P.P.I.E. A few good young boars ready for service, sired by I. B. A. Wonder. A fine lot of fall pigs. I please you or refund your money. W. A. Young, Lodi, Cal.

Large Yorkshires—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

Superba World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

Cholera Immune Berkshires—Fine sows, bred to excellent boars, for spring farrow $50 and $60 each. Splendid August and September boars and gilts $20 and $25 each. W. H. Waugh, Riverside, Cal.

Registered Poland-Chinas, prolific, fabulous, profitable, porkers. Choice young boars now ready for service, $25 each, weanlings $15 each. Dr. J. A. Crawshaw, Hanford, Cal.

Thirty Medium Big Type Poland-China boars for sale. Shipped on approval. We will send a good one for $30 and a crackajack one for $50. Bernstein Ranch, L. C. Trewhitt, manager, Hanford, Cal.

Choice Boar Pigs for Sale. Sired by Superba 220620, champion Poland boar at San Francisco. Prices right. C. R. Hanna, Riverside, Cal.

TURKEYS

GIANT BRONZE TURKEYS

Let me tell you how to make more money on turkeys. Large turkeys can be raised at practically the same cost as small ones. It is in the strain. By scientific cross-breeding I have developed a strain of turkeys which mature rapidly, and attain unusually large size by holiday time. You can introduce some of this blood into your flock and make money by it the very first year. Gold Nugget strain wins again. At Pacific Coast largest shows, 1916, the California and Arizona State Fairs and San Diego, also the great Los Angeles Show 1917, eleven prizes, eleven entries. Stock and eggs from my flock should put you in the Giant Bronze Turkey lead in your locality. Toms for sale, also eggs. Write for circular. Raised on 320-acre farm. Address J. Will Blackman, 607 East Third St., Los Angeles, Cal.

For Sale—Young bronze turkey hens, 6 to 8 lbs., $2 each. E. A. McKinley, R. F. D., Ukiah, Cal.

The Rocky Road to Dublin
would hold no terrors for the 1917

Indian Motocycle
With Powerplus Motor

For on the roughest, ruttiest roads the *patented* Cradle Spring Frame swings into action at any speed, smoothes out the bumps and absorbs all shocks and vibration. Thus the life of the machine is prolonged and the wear on the tires reduced.

The Powerplus is the strongest, fastest, most powerful motorcycle. It has won every endurance contest of any importance, establishing many world's road and track records. It is cleanest—all working parts are enclosed. It is quiet. Its cost of upkeep is lowest.

Ornament Your Home Grounds with Roeding's Evergreen Trees Shrubs Palms Vines Roses

FREE LANDSCAPING SERVICE

Service is becoming a great factor in every business, and the Nursery business is no exception. Many people who have both small and large places to improve are at a loss in many cases as to the plan to follow in laying out their grounds, and also in the selection of the trees, plants and shrubs, which will, as their place grows older, add to its beauty. In order to assist interested parties, we will on application mail you our SKETCH PLAN CROSS-SECTION BLANK, upon receipt of which you can make a rough sketch and mail to us, and our Landscape Department will send you a rough outline and recommendation for planting. No charge is made for this service.

THERE IS NO UNBELIEF

There is no unbelief;
Whoever plants a seed beneath the sod
And waits to see it push away the clod—
He trusts in God.

There is no unbelief;
Whoever says, when clouds are in the sky,
"Be patient, heart; light breaketh by and by,"
Trusts the Most High.

There is no unbelief;
Whoever sees, 'neath winter's field of snow,
The silent harvest of the future grow—
God's power must know.

There is no unbelief;
Whoever lies down on his couch to sleep,
Content to lock each sense in slumber deep,
Knows God will keep.

There is no unbelief;
Whoever says "tomorrow" "the unknown,"
"The future," trusts that power alone
He dares disown.

There is no unbelief;
The heart that looks on when the eyelids close,
And dares to live when life has only woes,
God's comfort knows.

There is no unbelief;
For thus by day and night unconsciously
The heart lives by the faith the lips deny,
God knows why.

—Lizzie York Case.

THE KITCHEN GARDEN

Written for California Cultivator
By John N. Gardiner

WHILE the writer has a patch of ground about 42x90, used exclusively for the growing of vegetables, he does not aim to keep it all producing at one time. My plan is to set aside half of the area for spring and summer crops, the remainder for those of fall and winter. By this arrangement that part not actually growing vegetables is being prepared for later use.

In order to maintain fertility the use of barnyard manure is advocated by the best authorities, if it can be had without difficulty or great expense, as this contains several fertilizing elements in varying quantities, besides the straw so necessary to supply humus. This decaying matter keeps the soil light and porous, causing it to retain moisture, and rendering it more easily cultivated. If manure cannot be had, the next best is to grow a cover crop, i. e. a succulent growth of peas, vetch, clover, barley or something similar, which, when it has attained its full growth, can be turned under either by plowing or spading in. I have followed this latter method for several years, although using stable manure as well, adding at the time of sowing the vegetable seed some commercial fertilizer in addition, in order to hasten maturity of the crop. I sow only small portions of this prepared land at a time in order to avoid maturing too much of one kind of vegetable simultaneously.

After my spring crops are about all harvested, which is usually some time in July, I commence sowing buckwheat broadcast in the unoccupied places. This grows quickly during the hot weather, specially if frequently irrigated or sprinkled. In about six weeks it will bloom and the seeds will ripen and fall to the ground. The tops can then be spaded in and within a short time it will be seen coming up again. After this second crop has gone to seed, a third will come, providing the season is not too far advanced, but the stand will not be as heavy as before. This method can be followed at little expense, as the cost of buckwheat seed and commercial fertilizer is small compared with that of stable manure. Even if manure can be had, this arrangement will still be beneficial to the soil. Towards the end of the year barley or peas may be sown for a cover crop, as both will withstand the cold better than the buckwheat.

Many persons fail in vegetable culture by planting out of season, and when nothing develops, they become discouraged, blame it on the seed or the dealer, and give up. If one will but procure a catalogue from any reliable seedsman, the tables therein will show when the various seeds should be sown to get the best results.

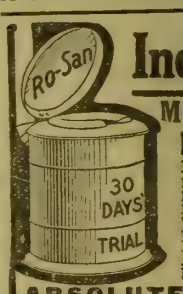
There are both warm and cold weather vegetables, and it is useless to endeavor to start any summer seeds in the open ground during the very cold months, which are usually December and January. This has been specially true the past few months, during which we have experienced more continuous cold weather than for many years. However, seeds for some summer vegetables can be sown in a hot-bed, if facilities for such are available, the young plants to be transplanted to the garden later, but this hardly pays on a small scale. It is better to save time and trouble by buying from a dealer young plants of tomatoes, peppers, egg plant and sweet potatoes, which may be had usually early in March and after setting these out in the garden just where they are to grow.

I make a practice of sowing seeds true to a line, which facilitates both cultivation and irrigation. In this way when irrigation is necessary, a furrow can be made on both sides of the plants, filled with water, and after it has soaked in, the earth drawn back again, thus conserving the moisture and preventing a crust forming on the surface. The water will thus reach the roots where it is most needed, will last longer and be worth more than any superficial sprinkling. When irrigating large plants like tomatoes, peppers and egg plant, it is better to form a basin around each and fill with water several times, after which the earth can be replaced.

Do not burn clippings, prunings, or other garden refuse; they are valuable, but either pile them up, wet and cover with earth, or dig a hole in some convenient spot and fill and cover as above, and after it has become rotted, it will prove a useful addition to your growing plants. It may also be screened and used as a mulch over sowings made during summer when seeds are apt to perish for lack of moisture. A little of this scattered on top of the ground after the seeds are planted will prevent a crust forming, which the young shoots would have difficulty in penetrating.

Make it a point to sow only such vegetables as you like, and not take up a limited space raising crops to be thrown away later.

When planting, do not forget the lowly onion. With present market prices of $10.00 to $12.00 per hundred wholesale, and two pounds for 25 cents retail, there is an incentive to grow them yourself. The onion makes roots near the top of the ground, so requires rich soil to develop to perfection. The best fertilizer is poultry manure. Care must be taken when using, as it heats up quickly when wet. If a small patch of ground can be covered with this manure, and immediately turned under, wet from time to time, and turned over again, the soil should be in prime condition for a good crop. A small quantity can also be added at intervals during the growing season with much benefit, on the theory that small amounts of fertilizer applied from time to time are better than a large quanti



Indoor Closet
More Comfortable, Healthful, Convenient

Eliminates the out-door privy, open vault and cesspool, which are breeding places for germs. Have a warm, sanitary, odorless toilet right in your house. No going out in cold weather. A boon to invalids. Endorsed by State Boards of Health.

ABSOLUTELY ODORLESS
Put It Anywhere In The House

The germs are killed by a chemical process in water in the container, which you empty once a month. **Absolutely no odor.** No more trouble to empty than ashes. Closet absolutely guaranteed. Write for full description and price.

ty all at once. Onion seed may be sown anywhere in the garden, and when the plants are as large in diameter as a lead pencil, can be transplanted to a permanent bed with rows 12 to 15 inches apart and plants five inches apart in the row. If one desires to save time, the sets may be had from a dealer and planted in the same manner. In a few months you may either use them for green onions or wait until they reach full size and ripen, at which time the tops will wither and turn brown. They may then be pulled, cured and stored for future use. The onion is one of the most profitable vegetables to grow, even in times when prices are low, by reason of the method of culture, the plants being close together, and in consequence a large number are produced in a small space.

Another most prolific vegetable is the string bean, of which the Kentucky Wonder is without a rival. My method is to plant a dozen or so seeds in a hill, after first removing three or four inches of soil. After the plants reach a height of several inches the earth may be gradually filled in around them, the object being to have the roots deep where the soil is cooler and more moist. Later leave four of the strongest plants and pull up the others. I have grown vines of this variety 12 to 14 feet high, which produced pods nine inches long of the choicest flavor and texture. The vines will, of course, require poles or stakes of some kind upon which to run. Last season I purchased from the lumber yard some 2x2 rough redwood, cut to 14 or 15 feet long. These I stained for preservation after cutting one end to a point. When not in actual use they are stacked up awaiting the planting season, and I expect them to last many years. By planting two or three hills at a time, about a month or so apart, you will have beans galore all season. This deep method of planting can be applied also to summer squash, thinning out later to two or three of the strongest plants to the hill.

I have concluded that if my vegetables cost as much to grow as it would to buy them, that I am still ahead, as the quality is better, the freshness unequalled, while the exercise, pleasure and recreation derived from the work cannot be measured in dollars or cents.

So, I say to all having a piece of ground available, no matter how small, grow something, and thank your lucky stars that you are living in a land where some vegetable can be grown the year round.

PRIZE WINNERS

All the kitchen garden articles received in answer to announcement of this month's contest were exceptionally good and so nearly equally good that the deciding on prize winners was difficult.

The first, or $2.00 prize, has been awarded to John N. Gardiner; second, or $1.00 prize, to Mrs. John Norton. The other two articles published by "The Lady of the Garden" and Clara I. Remington will bring their writers each a year's extension of subscription to the Cultivator, which is equivalent to $1.00—or more. The offer was for only three months' extension, but the articles were so well written that we are glad to make it one year instead. Through lack of space all may not appear this week; if not, they will later.

MARCH CONTEST

The next contest will give everybody a chance to come in again. It will be a recipe contest. This time for the meat or meats you find that "go farthest", that means, cost least according to their food value. What meat is your family standby, that everybody likes and is reasonably cheap?

Cash Prizes

For best $2.00 in cash will be given; for second best $1.00. For all others published three months' extension of credit to California Cultivator.

With your recipe send name and address of one to whom you wish extension given.

Recipes will appear in Cultivator of March 31. They should be received in this office by or before Thursday morning, March 22.

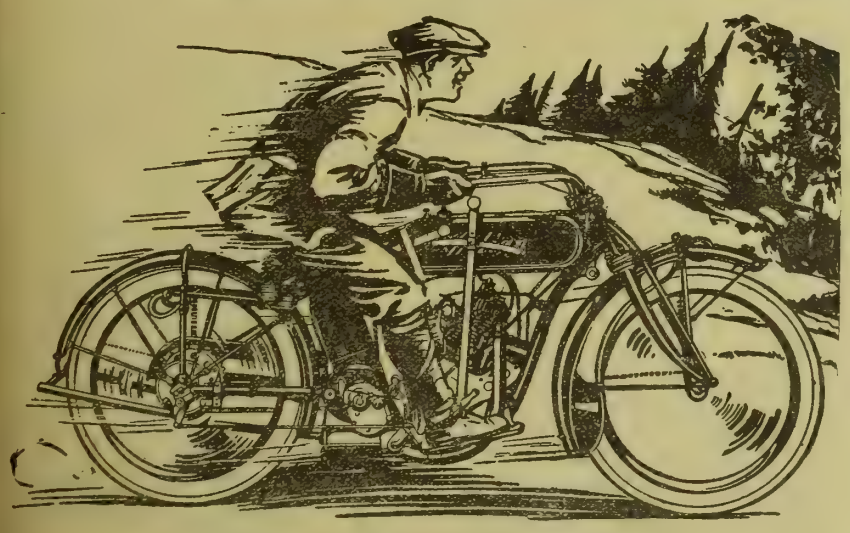
This $290 Motorcycle Given Away

Many Have Already Secured Machines Under Our Easy Plan



Turn your spare time into a prize like this.

Send in your name today and turn your spare time into cash.

Wouldn't you like to own this $290 Indian Powerplus Motorcycle without its costing you a cent?

We are going to give away this machine and many other valuable prizes and cash pay in return for doing a little subscription work for us. This is easy work because our paper is so well and favorably known and you can do the work during spare time. Eleven others have already won motorcycles in this way with far less dollars in subscriptions secured from others than it would have cost in dollars to buy the same machine of a dealer. We will explain this when we hear from you. You do not know how easy it is and how much money you can make until you write and find out all about it. Send your name and address on the blank below and we will send complete description of the machine and full information about the campaign just starting and letters from others who are now owners of these machines. This will place you under no obligation to us whatever if, after reading about the plan you decide not to go ahead.

This is the easiest and best way to get a motorcycle. No one can get very many subscription in our short campaigns. It costs you nothing to enter and you do not even have to be a subscriber to California Cultivator.

This motorcycle is the best one you can get. It will give you more pleasure than anything of equal value that you could own. Eleven others have been given away that were quickly and easily secured and some one is going to get this motorcycle April 7th, 1917. It might as well be you as anyone. We are ready to turn over to you in CASH and prizes what we would pay somebody else for doing this work for us. You can do the work right where you live during your spare time.

VALUABLE PRIZE FOR LITTLE WORK

Arthur Allison of Whittier won the motorcycle given away December 31 with far less dollars in subscriptions secured than the motorcycle would cost of a dealer. He was glad he sent in his name. He won the motorcycle easily as many others have. He writes:

Whittier, Cal., January 30, 1917.

Cultivator Publishing Company.

Gentlemen: I entered the campaign which has just been completed by the Cultivator Company and was successful in winning the $290 Indian Motorcycle. The campaign was fair and square in every way, and I was much pleased with the way it was carried on. I would advise anyone that has a little spare time to enter the next campaign, which is soon to start. It is a valuable prize for a small amount of work. Yours truly,

ARTHUR W. ALLISON.

WAS JUST AS REPRESENTED

Manager Motorcycle Campaign. —

Dear Sir: I received your letter asking what I thought of the campaign that you had about a month ago. I will say that the motorcycle I won was just as represented and the campaign was managed in a way that suited every one, as they were all treated alike. The more I ride, the more I want to ride it. Again thanking you for the kind treatment I received from you people, I remain, your friend,

C. F. ERBERT.

HE WON OUT EASILY

Manager Motorcycle Campaign.

Dear Sir: I am writing to let you know I received the first prize motorcycle and sure am pleased with it. It sure is a dandy. It was worth working for, and I also say the way you managed the campagin was sure on the square, and I think others who may enter one of your campaigns will say the same, and I hope those who enter will win out as easily as I did.

C. S. KELLEY.

SAYS IT IS EASY TO WIN

Manager Motorcycle Campaign.

Dear Sir: I received the motorcycle, and it is sure a dandy. It is easy to handle. I have not found a place it won't pull. I would advise every boy to get busy on the next campaign, for it is easy to win and everything is straight.

E. B. PREEDY.

Don't wait—send in your name and address on this form.

Manager Motorcycle Campaign, California Cultivator,
115-117 North Broadway, Los Angeles,

A House of Four Hundred Hens

Written for California Cultivator By Jean A. Koethen

MOTORING out Fourth Street in Santa Ana the other day we came upon the ideal poultry house. Its builder, Mr. J. N. Osborn, was a carpenter before he turned poultryman, and if his 400 odd bred-to-lay Rhode Island Reds do not do good work it cannot be because they are not comfortably housed.

The house, which is built after a Petaluma model, is 48 feet long by 16 feet wide, eight feet high in front and six in the rear, and is built of carefully matched lumber. It is divided into four sections, each 16 x 48, and each intended to hold 100 hens. These sections are separated by ten-foot partitions, which leave a six-foot alley along the front.

The dropping boards are built two feet ten inches above the floor, which is entirely covered with deep litter, so that every foot is available as scratching space. The roosts are 1¼ x 1¾, and are hung from the roof by heavy wire. "You will never be troubled with mites", remarked one of our party. "I never have mites," declared Mr. Osborn, "I spray ahead of them."

One of the best features of this house is the cement floor which is three inches thick, over the bottom of the house, and seven inches thick on each side, forming a foundation for the wooden sills on which the building rests, and making a floor which is mite proof, moisture proof and rat proof. Rising as it does four inches above the ground all around, regardless of doors, it protects the interior absolutely. Looking at such a floor as this one wonders how poultrymen have managed all these years with dirt floors.

Essentially open-front, the house is yet not open front. That is, it is open enough for ventilation, yet closed sufficiently for purposes of protection. Being eight feet from sill to roof edge, there is an abundance of room for nests and feed hoppers with nearly four feet above them for the entrance of sun and air. The feed hoppers or troughs come first, being built near the ground, accessible from both sides and protected by slats. Above these, and ranged along the alley, are the nests which are built with hinged tops of such a slope that no hen can possibly find footing there. This in itself saves considerable cleaning, and the use of shavings and sawdust in the nests saves more, for mites find little comfort in wooden nest litter.

The feature which makes this house essentially "different" is the arrangement for keeping out rain and letting in air and sunshine along the front of the house. This consists of four canvas-covered frames, each 16 feet long by three feet six inches wide, and hung from the middle, so that they may be swung into either a horizontal or a vertical position. Hung vertically, they keep out rain and wind. Swung into a horizontal position they permit the sun to reach the farthest roost. At all times, whether open or closed, they admit the air.

This house, which has just been completed, Mr. Osborn says has cost him $300, and he has done nearly all the work himself. Under ordinary conditions, with the work hired, it would cost $400, or perhaps a trifle more. This is just about the dollar per hen which is usually allowed for a good, substantial hennery.

Poultry Questions and Answers

Trouble with Incubator

How should I manage my incubator to get a better hatch? My hens hatch all they have but nearly one-third of the eggs that I put in the incubator die at the time of hatching.—Subscriber.

I am not told where the writer of this letter lives, how long the incubator has been operated or whether the directions sent out by the incubator manufacturer have been followed with undeviating exactness. Failure of chicks to break the shell at hatching time is likely to be due to lack of moisture, but one dare not advise without full knowledge of the facts. If inquirer will send postal to Agricultural Experiment Station, Berkeley, asking for Circular 156, "How to Operate an Incubator", she will have fuller directions than could possibly be given here. Professor Dougherty says in this circular: "It is evident that ventilation and moisture conditions are closely related and cannot be considered as separate problems. They must be handled together. Geographical location, time of year and other factors will have to determine whether artificial means of adding moisture to the air entering the egg chamber is necessary or not. Always follow the instructions sent out by the incubator manufacturer until sufficient experience has been gained to enable one to act intelligently in making any change that may appear advisable. The increase in size of the air cell, the drying of the membrane exposed when the chick pips the shell, the collection of moisture on the inside of the glass of the incubator door and the ease with which the chicks break from the shell, together with experience, will serve as definite guides in properly regulating moisture conditions and ventilation in artificial hatching. If the machine is a new one, it is very likely that the agent from whom it was purchased can help the user to find why the chicks do not hatch as they should."—J. A. K.

Trap Nests

Please give directions for making trap nests.—Subscriber, Hughson.

The Cultivator has given in the past articles on the making of trap nests, with illustrations, but as there are so many good ones manufactured which are not patented and the making of one is so much more simple when it can be done with the completed nest for a model, many poultrymen have found it wise to buy one which is known to work satisfactorily. However, Mrs. Koethen's "Poultry for Profit" on pages 167 and 168, gives particulars with full illustrations of the Oregon trap nest, also illustrations of the Missouri, and the department of agriculture trap nests. This, by the way, is an excellent poultry book which should be in every poultryman's library. It may be had with one full year of the Cultivator for $1.75.

Have the roosting places sufficiently large for each hen to have comfort.

Scald the drinking vessels before they become slimy.

PEACH PRICES

The California Peach Growers announces price list No. 6. Please note the following advance in prices, effective Saturday, November 18, 1916, at 6 p. m. All prices are f.o.b. factories, California common points, but no orders will be confirmed by us, at the following prices, unless f.o.b. factories where grades and varieties desired are available. All quotations are subject to our approval of variety and assortment, subject to our confirmation and subject to advance without notice: November, December and January shipment.

Price list No. 5 is hereby withdrawn, and ineffective after 6 p. m. Saturday, November 18, after which time prices herein quoted shall apply.

	Yellows.	Muirs.
Standard Peaches	.06¼	.06¼
Choice Peaches	.06½	.06½
Fancy Peaches	.07¼	.08⅛
Extra Fancy Peaches	.08	.08⅝
Slab Peaches	.....	.05½
Choice Peeled Peaches	.....	.09¾
Fancy Peeled Peaches	.....	.11

Above prices bulk basis.

For 50-lb. bxs., unfaced, add	½c
For 50 lb. bxs. faced, add	⅝c
For 25-lb. bxs., unfaced, add	⅝c
For 25-lb. bxs., faced, add	⅞c
For 10-lb. bxs., unfaced, add	1¼c
For 10-lb. bxs., faced, add	1½c

For prices on graded peaches, original, in bags, add ⅞c to the bulk basis prices above quoted.

	—Per Lb.—	
Ungraded, original bags	.07⅛	.07⅜
Choice Unpld. 1-lb. cart.	.08½	.08⅝
Choice Unpld. 5-lb. cart.	.08¼	.08⅜
Fancy Unpld. 1-lb. cart.	.09¼	.09⅞
Fancy Unpld. 5-lb. cart.	.09	.09¾
	Per Lb.	
Choice Peeled 2-lb. Cartons	.12	
Choice Peeled 5-lb. Carton	.11¾	
Fancy Peeled 2-lb. Cartons	.13¾	
Fancy Peeled 5-lb. Cartons	.13¼	

The above prices are guaranteed against our own decline to March 1, 1917, and apply only to sales and shipments made direct to the recognized jobbing trade. No goods will be confirmed at above prices to Coast or Eastern brokers, or to speculators, it being our object to eliminate speculation in dried peaches, we preferring to carry our stock in storage here on the coast until actually required by the jobbing trade.

HAY

Scott, Magner & Miller say under date of February 17:

Receipts past week 1617 tons, last week 1806 tons. Receipts consisted of all grades from fancy wheat and red oat down to the stock hay. Pasturage has been scarce throughout ranges owing to cold, dry weather, necessitating the feeding of baled hay in large quantities. Alfalfa has followed the general trend of the market and is firmly held at advanced prices. Straw is scarce and selling at top figures.

Citrus Fruit Market

LOS ANGELES, Feb. 21, 1917.

Best grade regular sized fruit is decidedly higher and the demand is keen. Off sizes and low grade fruit still gong very low, some barely paying freight and packing charges.

The lemon .market. is good and the prices generally higher.

Shipments

Shipments of oranges from Southern California since November 1, 1916, 7880 cars, lemons 1641, total 9521; to same date last year, oranges 6833, lemons 1762, total 8595. From Central California to date this season, oranges 4017, lemons 152, total 4269; to same date last season, oranges 4177, lemons 132, total 4309. From Northern California to date this season, oranges 842 cars; last year 609.

ANOTHER GOOD GUERNSEY RECORD

A Guernsey cow has just completed a record which secures for her sixth place in the junior three-year-old class.

Langwater Desire 40709, owned at Langwater Farms, Massachusetts, is the cow that has done this by producing 14,219.8 pounds of milk and 708.69 pounds of fat. She is an ideal dairy cow of great size, splendid dairy type, and has a magnificent udder with large well placed teats. She combines in her pedigree some of the great show ring and producing animals of the breed.

Worn Out Soils Made Productive

by using

Hauser's Organic Fertilizers

Science and practice both indicate that Nitrogen and Phosphoric Acid are necessary to produce the best results from the Citrus Orchards, and these two essentials are most prominent in organic fertilizer. Hauser's Organic Fertilizer is a concentrated soil builder and fruit producer. Put back into the soil at least a portion of the natural elements the orchard has taken out.

Home Products

Send for booklet "Good Reasons," tells you why "Natural Fertilizers" fertilize and return you many times the money spent for this unexcelled plant and tree food.

160 ACRE FARMS IN WESTERN CANADA FREE

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from $15 to $20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get near $2 for wheat and raise 20 to 45 bushels to the acre he **is bound to make money**—that's what you can expect in Western Canada. Wonderful yields also of **Oats, Barley and Flax. Mixed Farming** in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

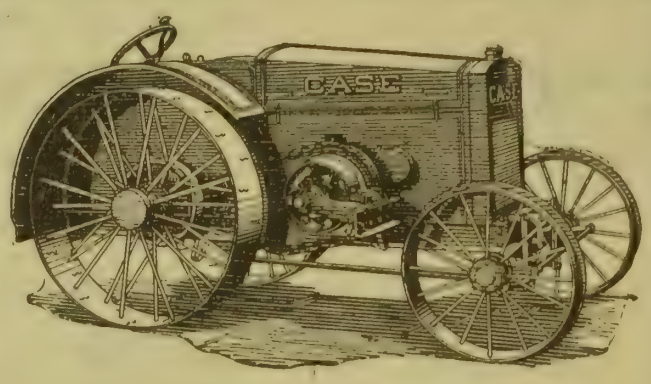
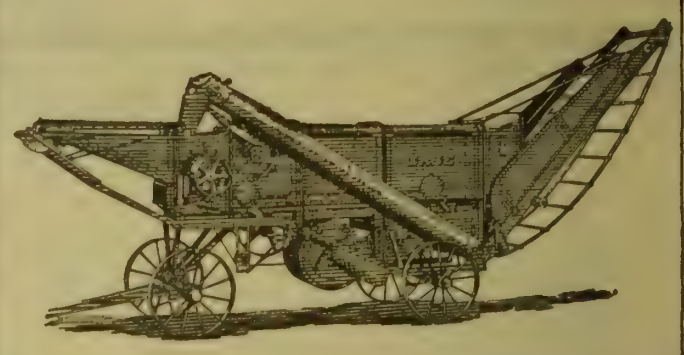
CASE

9-18 Tractor



20x28 Thresher



Every Farmer Wants a Combination Like This

Above we picture a Case 9-18 all-'round farm tractor and the new Case 20x28-inch thresher. Here is a combination which can't be beat. It brings to every farmer a new independence and greater economy. We are the first in the field to satisfy the growing demand for such a *handy team* of machines as this.

Even if you are not in the market today, you should be thoroughly acquainted with these remarkable labor-savers. They are described and pictured, together with the complete Case line, in our new 75th anniversary catalog, just off the press, which will be sent to you free upon request.

CASE, the Standard Tractor

The Case 9-18 tractor is truly an all-'round mechanical farm horse because this tractor is so useful.

It will pull manure spreader, gang plow, harrow, grain drill, planter, digger, mowing machine, rake, hay loader, harvester, haul crops and other materials.

It will drive a small thresher, a silo filler, feed grinder, fodder cutter, corn sheller, wood saw or hay baler. It operates a milking machine, also dynamo for electric lighting, and many more jobs.

This Case 9-18 has a four-cylinder valve-in-head special tractor motor, and is built for continuous hard pull without overheating. All gears are enclosed and run in oil. Center of gravity low down; therefore no danger of upsetting. Short wheelbase makes for easy turning in close quarters. A boy can operate it.

Don't buy a tractor before you've learned all about the Case. It pays to investigate thoroughly. If you're from Missouri, we "can show you."

The Sign of Mechanical Excellence the World Over.

Do Your Own Threshing

Thousands of farmers have asked us to add a smaller thresher to our line, so that they might do their own threshing. They have come to us because Case has long been the leader in the threshing machine business. So we have designed and built the Case 20x28-inch. It is especially adapted for small tractors. While we recommend the Case 9-18 all-'round tractor with it, this 20x28-inch separator can easily be driven by other power of like capacity.

With the Case 20x28-inch thresher there is no need to await your turn and run a risk. You may thresh as much as you please, whenever you please. This means absolute independence. Also extra profits, if you have time to handle some of your neighbors' crops.

The Case 20x28-inch thresher maintains the same standard of excellence as the larger models, which is sufficient proof of its performance, economy, durability and results.

We want You to know all about this Case 20x28-inch thresher before you purchase a machine. Samples will be gladly shown at all of our 44 Branch Houses.

J. I. CASE THRESHING MACHINE COMPANY, Inc., 356 Erie St., RACINE, WIS.

FOUNDED 1842

(490)

Four other Case tractors besides the 9-18, as follows: 10-20, 12-25, 20-40 and 30-60. A size for every need—a size for every farm.

Eight sizes of Case steam engines: 30, 40, 50, 60, 65, 75, 80, and 110 h. p. None as good as these have ever been manufactured. They have proved superior.

Seven Case steel threshing machines in the following sizes: 20x28, 20x36, 26x46, 28x50, 32x54, 36x58 and 40x62 inches. These meet every demand. Case threshers always set the pace.

Case baling presses, in two sizes, 14x18 and 17x22 inches; also a 17x22-inch automatic baler. They do the most work in the least time.

Case silo fillers have big capacity and require least power. Their performance is unequalled, like all other Case products.

The National Orange Show

A Little the Best Show Ever. About the Same Amount of Rain as in Other Years. Citrus Growers Meeting Inaugurated Movement for Practical Changes in Later Fairs

IT rained during the citrus fair week; it always does—at least nearly always—and the rain was needed and was worth millions to the state's citrus producing section. Nevertheless it was a disappointment to the management after making such complete arrangements and installing one of the finest citrus exhibits, both in features and in quality fruit, ever shown. However, the rain came down and took away the beauty of the street decorations and prevented many from attending and to an extent at least injured the exhibits which had been placed.

Two mammoth tents had been erected and they were filled to the limit. The features could not be entirely different from those of preceding years, yet there were many novelties and we think in the main a more finished touch. The practical grower was heard to remark that he wished less attention could be given to these features, often made up with fruit of indifferent quality, but like the railway collisions at the state fair, the side shows and other attractions of the ordinary street fair, the citrus fair must have something to bring gate receipts. The features are a strong drawing card and we doubt not will always be continued. There will be the railway train made of oranges or other fruits; there will be the swans, the bears and other animals; and these need not take from the quality and commercial exhibits.

The convention which was held on Friday called attention to the quality exhibits, to the need for revision of score card and to the advisability of encouraging more and better exhibits of plates, of boxes, and especially of commercial packs. There was a packing plant in operation, but this more to give to the Eastern visitor an idea of the methods of packing and to give opportunity to secure small and attractive packages for sending to Eastern friends.

At the convention the remark was made that the manager of every packing house in California should take the opportunity to be present, should make an exhibit of the best his house can produce, should examine the packs made by other houses, and should study every question connected with the problem of sending from California fruit that will increase the reputation of the state not only as a producer of the finest oranges in the world, but as the packer of the finest appearing product. The fact that California has already won a reputation for fine picking and fine packing does not preclude opportunity to develop further efficiency, especially in the line of more uniform pack. The point was often referred to that a fancy or choice grade of one packing house was not necessarily an indication of what the same grade would be from another packing house. Hence the appeal for making more of this opportunity another year. A committee was appointed, but regarding this committee more below.

As one entered, the first tent was given entirely to feature and quality exhibits of citrus fruits. There were some citrus fruit products exhibited, but there should be more. As to the attractiveness of the features and the winners of the awards, the list given below is the best comment.

The tent adjoining the one in which the quality exhibits were made was given over to concessions. There was almost every merchantable product from autos to lemon face cream. A few of these were of interest only to local people, but the implements and tractors and farm power exhibits held the attention of many a citrus grower and in a way which showed that the orchardist is talking as to how to produce more with less expenditure.

The citrus growers' convention under the auspices of the management of the show held its sessions in Moose Hall. Prof. D. L. Crawford of Pomona College presided. The welcome was given by Joseph Ingersoll, president of the orange show. Prof. Crawford responded for the fruit growers and Dr. Webber, director of the citrus experiment station, and Mr. Fleet of the Sespe Rancho talked on pruning and J. P. Inglehart of Glendora gave of his methods. These pruning articles called out warmest of discussions.

Dr. Elwood Mead, chairman of the commission on land colonization and rural credits, discussed both rural credits and land colonization, but gave most of his time to the latter question. He referred to the lure of ownership of home and enlarged upon the advisability of recognizing this desire to own a home and called attention to the comparatively small number of American people who now own their own homes. Tenancy is increasing every day. To aid in securing homes the federal government through its farm loan bureau will loan to farmers at five per cent interest plus one per cent amortization a sum equal to half the agricultural value of the land.

In addition it is now hoped that the state of California will join in this campaign, at least to the extent of acquiring an experimental tract of land to be subdivided and placed at the disposal of young farmers of from 21 to 35 years of age. In this state there are hundreds of thousands of acres untilled. These lands must be improved, and it should be done in a way that will give opportunity to the young man with willingness to work, with farming experience and with at least a little capital. The state should, if necessary, build homes for them.

As showing the need for this encouragement by the state and nation Dr. Mead called attention to the fact that a canvass of the attendants at the college of agriculture of the University of California showed that more than 60 per cent would be at the completion of the course entirely without capital, and but very few of the 40 per cent would have sufficient capital to engage in agricultural practice to any material extent.

At the close of the convention Dr. J. Eliot Coit, who was one of the judges of the quality classes, called attention to the need of revision in score cards and to the establishing of what is a perfect navel orange or what is a perfect lemon. To the end that such questions might be given solution and to aid in giving suggestions to the management of the coming citrus fairs it was resolved that a committee should be appointed. Chairman Crawford appointed Dr. J. Eliot Coit, Messrs. Little of Riverside, Sharp of Santa Barbara, and C. D. Hubbard of Carpinteria, this committee to act and have power of making suggestions direct to the management of the National Orange Show.

Awards made by Judges J. Eliot Coit and D. L. Crawford are:

Best 24 boxes Washington navels: First prize, Etiwanda Citrus Fruit Association; second prize, Lindsay Chamber of Commerce; third prize, Mutual Orange Dis-

Some Questions Answered

National Farm Loan Board Replies to Points Often Raised. Federal Loans Soon Obtainable

SECRETARY Flannagan of the farm loan board has mailed us the following answers to questions which have arisen as to the workings of the farm loan. We may add that during the present month funds will be available for the capital stock of the 12 district banks has all been subscribed.

What constitues an "actual farmer"?

An actual farmer is one who conducts the farm and directs its entire operation, cultivating the same with his own hands, or by means of hired labor. An owner, to borrow under the farm loan act, must be responsible in every way, financially and otherwise, for the cultivation of his land.

What is the meaning of "equipment"?

Equipment consists of the implements needed in the conduct of a farm to facilitate its operation. It might consist of teams as well as machinery, tools and like articles.

What is the meaning of "improvements"?

Anything in the form of beneficial structure, or any useful, permanent physical change tending to increase productive value, such as clearing, tiling, draining, fencing, building etc.

Has a farm loan association the right to appoint an attorney to draw up abstracts and pay him out of its official funds, or should the members of the association club together as individuals and have this done?

Each borrower is required to furnish his own abstract and the applicant must stand the expense of preparing this abstract. An association has no right to employ any of its corporate funds to pay for the preparation of abstracts for its members. This must be an individual charge, and if members of an association club together to have this work jointly done they must do it as individuals and not as an association. Each borrower is free to make his own choice in the selection of an attorney or abstractor.

What will be the rate of interest?

Not exceeding six per cent. The exact rate cannot yet be told; one per cent more than the interest rate farm loan bonds will bear.

May members of a partnership borrow?

Yes, if one or both are farmers and engaged in the cultivation of the land mortgaged. Partners must join severally in executing the mortgage and one should give the other authority to represent him in the farm loan association, as only one can have membership.

Will the federal land banks make any charge for examination of abstracts of title?

The examination of abstracts, when furnished, will be made by the bank's general attorney at its office, and for this examination no charge will be made. In districts where abstracts are not obtainable except by examination of the records, the borrower will have to bear the cost of such examinations.

When a husband and wife execute a joint mortage should one give the other power of attorney to be the representative in the farm loan association?

Both husband and wife should sign the mortgage, but the one in whose name the title stands should be the member of the association.

What is the basis for appraising lands?

The appraisement of a farm should represent the best judgment of the members of the loan committee as to the value of the land in question, the principal factor being the productivity of the land when used for agricultural purposes, but taking also into consideration the salability of the land and prevailing land prices in that community.

What will be the size of the bond of the secretary-treasurer?

This will depend upon the size of the association. The bond need not be large enough to cover the aggregate amount of money borrowed by the members of the association because this money will be transmitted in such a way as never to be in the exclusive control of the secretary-treasurer. It should be large enough

Grading Walnuts

SOME time ago a Los Angeles County subscriber of the Cultivator asked the question as to the use of the term "budded walnuts," which are quoted by the California Walnut Growers' Association. The question was referred to Mr. Neff, who explained that the term applied only to Placentia Perfection and Eureka nuts because these two nuts were uniform in shape, size, texture and high quality of meats. Many other nuts which may be larger or even superior to these two are excluded from use of the term "budded" in marketing through the association. The subscriber came back with a communication from which we take these paragraphs.

"The California Walnut Association by its classification has abrogated to itself the use of the word "budded walnut." Members and officers of this association have contended in defense of this to the writer and others, that "budded walnut" was a trade mark and that they classified as budded walnuts only the Placentia and Eureka, thus improperly and unfairly outlawing and denying that any other walnuts are budded walnuts, using an unfair label or trade mark, at the expense and injury of all other budded walnuts.

"The California Walnut Association, by its classifying under the name of "budded walnuts" only nuts of the so-called Placentia or Eureka, is thereby publishing to the world in a trade way that there are no other budded walnuts, and that the walnut grower who seeks to sell his budded walnuts of other varieties on the market as budded walnuts is practicing an imposition on the public, when, in truth and in fact, they, in many instances have a budded nut, as has the writer in particular, and should be entitled to sell the same for what it is.

"If the California Walnut Association desired to do the right, just, and fair thing by the walnut growers of the state of California, instead of discriminating in favor of the so-called Placentia and Eureka, it would change its classification so as to market the Placentia budded walnut under the name Placentia for all it is worth, the Eureka for all it is worth, and other budded walnuts under the name under which they are entitled to be sold, or plainly as budded nuts. This certainly could work no injustice to anyone, and parties who have budded nuts that are the equal to, or nearly so, or better, than the Placentia or Eureka, could market their nuts through this association in fairness and receive all their product is worth.

"It is true that the California Walnut Association markets for those who are dissatisfied and refuse to accept the classification which they have adopted, the nuts of individual growers, by sample, which of course is entirely fair and just to the individual grower. However in connection with that they are doing the injustice of attempting to deprive all walnuts, except the Placentia and Eureka, that are in truth and in fact budded walnuts, the right to be marketed as such.

"The writer sold his walnuts, which are budded walnuts of an exceptionally fine quality, 75 per cent of which are as smooth as the Placentia or Eureka, larger and better filled, and with as uniformly white a kernel as any nut grown, and the balance of the nuts are exceptionally large and smooth considering their size, which would equal in most instances two of the so-called Placentias, these nuts selling this year in open market on sample, for 17½ cents, run of the orchard at the orchard, and out of the 11,000 pounds there were 32 pounds of culls.

"It is true that the California Walnut Growers' Association offered to market these nuts by sample as budded nuts. It is also true that if not for the conviction of the injustice that would have been practiced upon him had he marketed these walnuts without a protest through one of the branch houses, that the subscriber would have received only 15½ cents, if he correctly remembers the price for soft shells. Certainly this demonstrates the fact that the diligent and persistent demand for justice brings its reward."

The most inferior nut, even to the great overgrown one, extremely rough and which is all shell, often with absolutely no meat whatever inside, may be strictly a budded or grafted nut. This might be the result of lack of judgment on the part of the orchardist in budding something which he thought to be of high quality, or for some other reason, but as noted it would be a most inferior article and still from the horticultural standpoint "budded". For an association to establish a grade for marketing purposes and admit to that grade inferior products because strictly horticulturally they might qualitfy would be suicide. Admit for a moment that the association has erred in taking a word which might be construed as horticulturally not exclusively belonging to that product, still after having established a grade in the market are they to throw away the results of years of advertising and of effort either because the grower of a superior or of an inferior article may wish to take advantage of that brand, mark or classification? But use of such term in no wise injures others.

Some years since the citrus growers selected as a trade mark "Sunkist". To us and many others it seemed objectionable and had the distressing sound of the superlative degree of sunk. However it was retained and in spite (we believe) of any objectionable feature thousands, almost millions, were put into advertising it and making it a household word and now it must be retained. It is a great asset.

From the standpoint of nuts of higher quality but not with all the marks of the two nuts which have been admitted to the classification, it would not be wise to make ununiform the product in that classification. To put an extra fancy fruit or a number of packages of it into the choice or lower grade may at first be considered a favor to the consumer and help to build up the choice grade. On the contrary, the purchaser finds this exceptionally high grade stuff and he expects future consignments to maintain the same standard. The most important feature in using a grade for nuts or fruits of any kind is this matter of uniformity. For the Walnut Growers' Association to open its classification for budded nuts to all shapes sizes and qualities of nuts, simply because horticulturally they are budded nuts, would mean the early termination of the usefulness of the association. Business principles must prevail in cooperative associations as well as in a private business enterprise.

Nitrate Inducing Setting of Fruits

IN a report issued by the Oregon experiment station as to the effect of fertilizer and as to the effect of spraying nitrate of soda on the tops of fruit trees in the spring time, the opinion seems to be that the beneficial effect is more caused by the dissolving of the nitrate on the tree tops and carrying it to the roots. On this point the report says:

Experiments, however, lead the authors to conclude that the real reason why better results were secured from spraying nitrate of soda than applying it in the dry form was due to the fact that the nitrogen sprayed on the trees was dissolved and reached the roots, whereas the nitrates spread on the ground were added in May when the ground was dry, hence did not dissolve and reach the roots. In order to secure benefit from the nitrates they should be applied during the early part of March when the ground is sufficiently moist to dissolve them and also before the trees come into bloom. Nitrogen applied at this time has been found to cause a larger percentage of set of fruit in April, an important change in the character of the foliage, and a stimulation of the wood growth.

"The experiments indicate that the stimulating effect of nitrate of soda is more lasting in its effects than formerly believed and that its benefits will extend over into the second season and perhaps longer. The best method of applying nitrate of soda to orchards is to spread the dry crystals broadcast on the ground under the trees and harrow soon after applying. Six pounds of nitrate of soda, equal to about one pound of actual nitrogen, applied to a mature bearing tree is believed to be ample to restore seriously weakened trees to a normal condition. This amount should be reduced one-half the second year, the station's experiments showing that a full pound of nitrogen applied the second year produced too much wood growth and too much fruit that was undercolored and oversized. The cost of furnishing the required nitrogen at the rate recommended was $15 an acre.

"The above amounts of fertilizer are recommended for use only on trees which are in a somewhat run down condition as indicated by thin foliage, weak wood growth, small fruit, and the presence of certain physiological troubles, such as "fruit pit," little leaf, die-back, etc.

"Further experiments are to be conducted to confirm these conclusions as a whole.

"The authors point out that nitrate of soda does not exert much influence on the soil, and therefore in order to improve the physical condition of the soil in many orchards it is necessary to add organic matter. During the last two years those orchards which have used clover and alfalfa in the presence of sufficient moisture have shown a strong improvement. The use of these leguminous crops should be dispensed with for a while and systematic clean culture practiced when signs of overstimulation appear."

PRACTICAL FIG CULTURE

The agricultural experiment station of the University of Arizona has issued "Practical Fig Culture in Arizona," Bulletin No. 77. It is written by W. H. Lawrence. It is a 44-page bulletin and gives most complete instruction as to character of fig producing sections, temperatures, precipitation, scope of fig growing, groups of figs, classification, types, characteristics, soils, propagation, planting, pruning, cultivation, etc. We think any California fig grower who requests it may secure it from the Arizona station which is located at Tucson.

JOHN DEERE IMPLEMENTS

BETTER FARM IMPLEMENTS AND HOW TO USE THEM

BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-111.

JOHN DEERE, MOLINE, ILL.

The John Deere-Dain System Rake

Here is what you do with the Dain System Rake:

Follow the mower closely, rake while leaves are still active and place hay upon clean stubble.

Make straight windrows, and no dumping of rake is required. There is no bunching of hay in turning corners.

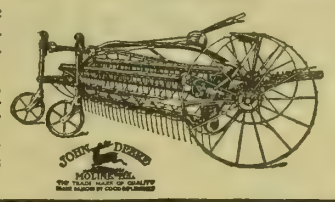
Put the hay in medium size windrows, with the bulk of the leaves inside and the majority of stems outside.

The windrows will be loose in the center for the free circulation of air. The hay retains its color and nutrition.

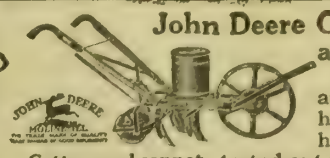
The John Deere-Dain System is the rake employed with the Dain System of Air-Curing Hay.

Reel raised or lowered, rake thrown in or out of gear and angle of teeth changed by means of convenient levers.

Ample capacity. The inclined frame grows higher where the windrow becomes larger—an exclusive Dain feature.



John Deere Combined Cotton and Corn Planters



John Deere Cotton and Corn Planters are highly successful. They have been thoroughly tested out through years of satisfactory field use. A cotton picker wheel extends through the bottom of the hopper. This wheel revolves in one direction and the cotton spider in the other—separating the seed without damaging it. Change in quantity is made by turning a thumb nut on the hopper.

Hoppers are beaded. Seed plates fit perfectly. All the seed in the hopper is planted. Peanut plates or a special hopper can be furnished for planting shelled or unshelled peanuts.

Cotton seed cannot choke up in the hopper—a cotton picker wheel prevents it.

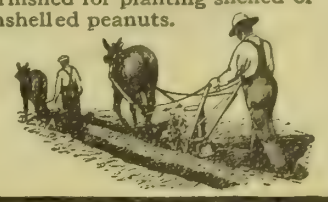
John Deere *OBLIQUE SELECTION, HORIZONTAL CELL DELIVERY SEED PLATE* for corn—an accurate drop.

Positive gear drive with dirt-proof gear case.

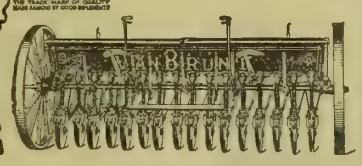
Special shaped shovel with reversible points opens furrow and pulverizes the soil without throwing it up on the face of the shovel. Soil falls behind and covers the seed.

Adjustable press wheel can be furnished. No lever ueed on this press wheel.

Depth of planting can be regulated with the foot while planter is in motion.



Van Brunt Grain Drills



Van Brunt Drills are particularly noted for their adjustable gate force feed. Each feed cup plants exactly the same amount. The seed is compelled to leave the seed box in even, continuous streams without bunching or choking up. All the ground is seeded.

The Van Brunt Single Disc is the first successful single disc grain drill with closed delivery. The seed is protected by metal seed tubes, disc openers and the disc boots until it reaches the bottom of the furrow.

Van Brunt Drills plant any small seed.

Amount sown per acre easily regulated.

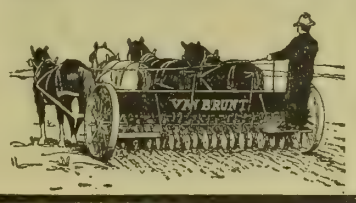
Direct, double, gear drive from the continuous axle.

High-grade discs with bearings guaranteed to last lifetime of drill. Scrapers keep discs clean.

Pressure springs individually adjustable to make uniform depth furrows.

Either single or double discs.

Grass seeder attachment which will drill or sow broadcast can be furnished.



John Deere Syracuse Plows

Syracuse Plows have an enviable field record among farmers in chilled or combination plow territory

Here is a feature that is appreciated by the man who buys a Syracuse Plow. Extras ordered will be duplicates of the original parts. Bolt holes will be in the right place. Every part will fit. In fact all necessary parts that go into a Syracuse Plow could be ordered as repairs and when received built into a complete plow. Extra parts are exact duplicates—no trouble results.

Remember, Syracuse quality is uniform.

John Deere-Syracuse Sloping Landside Chilled Plows are unsurpassed for general purpose work in light soils. They leave a clean, open furrow bottom.

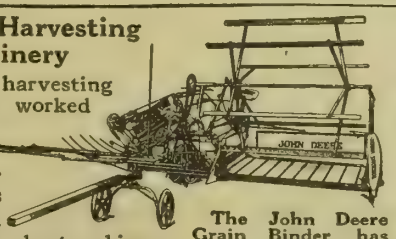
Share and shin piece combined—a fresh, clean cutting edge obtained with each new share.

Index or set-over style of beam—easily shifted to give the plow more or less land.

Equipped with Syracuse Chilled Moldboards—noted for satisfactory scouring qualities, strength and uniformity. Right and left hand styles.

John Deere-Syracuse Sloping Landside Chilled Plow

John Deere Harvesting Machinery



John Deere harvesting machines have worked under every possible condition—severe droughts that resulted in much light grain, short and irregular straw—extremely wet seasons, heavy grain, down and tangled.

However, the John Deere, "The Better Binder", has throughout maintained an unbroken record of success in cutting, binding and tying grain.

The John Deere Grain Binder has wide and high bull wheel—great power.

Main frame riveted—unusually strong.

Three packers instead of two, make better shaped bundles and save grain.

Accurate tying mechanism.

Quick turn tongue truck saves time, relieves horses and makes square corners and full swaths possible.

Your Home Town Dealer

There is a big advantage in buying implements of your home-town dealer.

He gladly "backs up" the implements he sells, and he is on the ground to see that they make good. He makes his home in your locality—the place his goods are sold.

He handles a line of high-grade implements—and you can see before you buy. In the busy season, when work is pressing, he can furnish repairs promptly for the goods he sells.

If, by chance, he hasn't in stock just exactly the style of implement you want, he can give you quick service in getting it to you.

John Deere factory warehouses with immense storage rooms have been established in various sections of the country. Every John Deere dealer is conveniently located to one of these houses.

This, really, gives you two supplies of implements—the stock carried by your home-town dealer and that of the factory warehouse.

JOHN DEERE, MOLINE, ILLINOIS

KIRKMAN'S RELIABLE TREES

The outlook for citrus is good. Orange, Lemon and Grapefruit trees planted in thermal localities will be profitable beyond any doubt. At our Citrus Nursery at Avocado, in Merced County, we have an excellent supply of all varieties of citrus trees. This stock has gone through the winter without any injury from frost. We can supply No. 1 Citrus stock on short notice, and will guarantee that the stock is entirely satisfactory. Our stock consists of a fine lot of

Eureka, Villa Franca and Lisbon Lemons

Marsh's Seedless Grape Fruit, Washington Navel and Valencia Oranges

Correspondence regarding your needs in Citrus trees respectfully solicited.

Three-Year-Old Eureka Lemon

High Grade Olive Trees In Nursery Row Two-Year-Old

"There is still time to plant deciduous trees. Telegraph your order and prepare your ground for immediate planting. We still have a good supply of

Apricots, Plums, Almonds, Peaches, Cherries, Prunes, Apples, Pears, Walnuts, Etc. Etc.

No variety of fruit holds better promise than the Olive in California. By far the greater portion of Olives and Olive products used in the United States is still imported from Europe, and the majority of the people of the United States have yet no knowledge of the food value of ripe pickled Olives. It is only a question of time until the great value of this fruit is known, and the demand will be doubled many times. Plant an Olive orchard now and insure a reliable income for your children and your children's children. We have a very fine supply of

OLIVE TREES

in Mission, Manzanillo and Sevillano varieties

Will quote very reasonable prices on extra high class trees.

Kirkman Nurseries

2501 Tulare St. - - - Fresno, Cal.

Best tray of 12 lemons: First prize, C. . Hubbard Fruit Company.
Best tray of limes: First prize, Highlanl hamber of Commerce.

Frost Protection

Address By Prof. R. S. Vaile Before Citrus Convention at San Bernardino

ATTENTION has been called again this winter (1916-1917) in a striking manner to the question of frost damage in citrus orchards and its pre-ention. The purpose of the present aper is to record certain observations earing on this subject, together with he writer's interpretation of same.

The Pomona frost protection asso-iation has had its riders out reading hermometers on 26 different nights rom November 13, 1916 to January 4, 1917. On 24 of these nights at east some part of the district has been ired. The Ontario association has had bservers out on 20 nights. The Li-oneira Company has fired over 20 imes. During such a siege large uantities of oil must of course have een consumed. Exact figures as to he amount are not at hand, but evi-ently the expense has been consid-rable. The lemon men as usual have een called on for the hardest of the ork, but certain orange groves have ome to the writer's attention which ave been fired as many as 15 times or a total of about 35 hours burning.

When the total number of frosty ights and the extremely low mean emperatures are considered the mount of actual damage to oranges n Southern California proper is com-paratively slight. Certain spots are adly hit but it is doubtful if ship-ments of first grade fruit will be re-uced over ten per cent from south of Tehachapi.

In view of these conditions growers are in certain cases very undecided as to the value of their attempts. It is hoped that the remarks which follow will be of interest to such growers. The writer desires to have it distinct-ly understood that this discussion re-fers to oranges. The situation with lemons differs in certain particulars.

Present Equipment

The writer has recently sent out a questionaire relative to the present equipment, its cost, maintenance and operation. An analysis of answers

Teague Trees are Quality Productive Trees

Because properly grown and budded from selected trees producing abundantly only quality fruit. Buds cut from carefully selected fruiting bud-wood only. In addition we give quality service in the way of digging, packing and delivery that insures success to the planter. Correspondence and inspection invited; our treatise on "Citrus Culture" and annual Price List sent on application.

R. M. TEAGUE, Manager
San Dimas, California

What are Pedigreed Trees? We want You to Reason Before You Buy Citrus Trees.

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries,—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertilizer, labor, investment tied up in land—these are the big factors that go to pot if, years after the trees are planted, the grove bears miscellaneous offspring.

Less work and bigger crops with Planet Jr. implements

"No gardener would do without a No. 4 Planet Jr if he would but try it. I would not take ten times its price and do without it," writes Isaac Kennedy, Owensboro, Ky.
Planet Jr implements are so well made that they not only do good work, but they last a lifetime. Fully guaranteed.
No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel-Hoe, Cultivator and Plow does garden work so quickly, easily and thoroughly, that it pays for itself in a single season. Sows all garden seeds (in drills or hills) plows, opens furrows and covers them, hoes and cultivates all through the season. 32 other styles of seed drills and wheel-hoes—various prices.

Planet Jr **No. 8 Planet Jr Horse-Hoe and Cultivator** does a greater variety of work and does it more thoroughly than any other cultivator ever made. It has stronger, better construction. Its depth regulator and extra-long frame make it steady-running. Adaptable to deep or shallow cultivation and to different widths. 15 other styles of one-horse cultivators—various prices.

March Vegetable Planting Calendar

Northern California

Written for California Cultivator By A. R. Gould

THE long looked for rains arrived last month and cheered us all, leaving an excellent impression on our early sown vegetable crops and putting the garden in better shape generally for further plantings.

Peas

We are still able to sow a good main crop variety or two, and Hosford's Market Garden, Senator or Stratagem may be used. Keep a close watch out for aphis or green fly on the early vines, and if any are observed spray with "Aphine" or "Black leaf 40" according to directions on the can. Cultivate between the rows as much as possible.

Onions

The onion bed should be also cultivated as soon as the seedlings in the rows are to be seen.

Carrots

Successional sowings of French Forcing, Danvers Half Long and New Intermediate. Cultivate thoroughly between the early carrots.

Cabbage, Broccoli and Kale

As soon as these plants are developed enough in the seed bed, which will probably be toward the latter end of the month, plant out, placing cabbage about 16 inches apart in the rows, which should be 24 inches apart. The same applies to broccoli but kale may be given a little more room in the rows. Plant firmly and use a setting stick, pointed, which may easily be made and will prove a useful garden tool. If planting is not followed by a few showers water the plants after having set out to give them a start.

Turnips

Those that were sown early should now be making much progress and will require much thinning out. Leave them nine inches apart in the rows. Make successional sowings of Early Snowball, White Milan and Orange Jelly. Keep the hoe or cultivator moving between the rows of the growing crop and look out for the slug and turnip fly. The former is best destroyed by slug shot or hand picking and the latter by the application of soot.

Beets and Swiss Chard

Make a sowing of Early Eclipse, Crosby's Egyptian and Detroit Dark Red. The latter is an exceptionally fine table beet. These should be grown in fairly rich soil and should receive a fair amount of moisture. Sow the seed in rows 18 inches apart.

Swiss Chard, or Sea Kale beet, is generally grown and the tops used for spinach, which it somewhat resembles after being properly cooked. The same cultural directions as for beets may be applied.

Lettuce

Continue to sow the varieties as advised last month and thin out the early crops; also transplant seedlings in prepared and fairly moist soil, placing the plants about ten inches apart in the rows.

Radish

Make successional sowings of the varieties advised last month.

Tomatoes

Secure a fairly deep box, say about six feet long by three feet wide, and place it in a warm location. Make up a seed bed in this, using a compost of garden loam, leaf soil and sand, and sow the varieties of tomatoes as advised last month in rows or broadcast. Keep the top of the box covered with glass, slightly shaded, and admit a little air only during the day until the seedlings appear and become established. The same idea may be used for other subjects such as celery and leeks, if th latter have not yet been sown, and it would also be useful to make a good sized frame for such a purpose. It is invaluable in the spring time.

Celery

Sow the varieties, White Plume, Golden Self Blanching, or Columbia in a box or frame as advised above.

Artichokes (Globe)

If these have not already been planted out or existing roots subdivided, do this without delay. Plant two to three feet apart in the rows, which should be at least four feet apart.

Potatoes

Secure seed (tubers) of such varieties as Early Rose, British Queen and Oregon Burbank. Although it is rather early to plant these, yet they may be placed in flat boxes placed near a window to sprout. They should in a few weeks be well sprouted and will then be ready to plant out when all danger of frost is over. Have your ground selected and well prepared and do not plant on any ground that was used for this crop last season.

Parsley

Seedlings of this may be transplanted towards the latter end of this month. Plant 12 inches apart.

Southern California

Written for California Cultivator By D. F. Reichard

THIS is the month to put all your spare time on the garden. The reward will be abundance! Let plantings be unconfined. The rains this winter have been most favorable in their amounts and occurrings. Those who have been liberal with the use of their cultivator and plow have their ground in fine shape now for the reception of seed and plants. If by some chance some part of the garden has not been worked, where grass and weeds are getting a good start, go after it at once and turn them under; they make the best kind of fertilizer. All weeds disposed of now makes hundreds less for next year, for they have not made their seed yet.

The high cost of all produce is a great inducement for all persons with a piece of ground, though it be only 10x10, to plant something. It is surprising to know how much can be successfully grown on a small area. Unless one has a quarter of an acre or more for a garden patch he had better not take up his room for potatoes they can be bought cheaper. The plot is put to better advantage growing more perishable stuff—that gives the fullest value when cooked or used the same day it is gathered.

Plant small quantities of the hardier vegetables for a continuous supply. As the ground warms up plant corn. Heath's Early is becoming very popular; cucumbers, Klondike is best for

P&O

LIGHT DRAFT PLOWS

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

P&O

Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Traction Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P&O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P & O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

Cultivate the habit of reading advertisements and get the news of the manufacturing world.

slicing; melons in variety; squashes. This is the last month to plant peas with much success, as they do not do well during the warmer months. Plant onions in variety for next fall and winter use. Set out all kinds of vegetable plants, protecting them when necessary. If there are to be any fruit trees, berry plants or shrubs to be set out, do so at once; it is advisable to get them in the ground before growth starts.

Spray with Bordeaux mixture or lime-sulphur solution for fungus diseases, such as curled leaf. Add Paris green or arsenate of lead for destroying gnawing insects. Spraying should be done before the buds burst and again shortly after the blooms fall.

March in the Flower Garden

Northern California

Written for California Cultivator
By A. R. Gould

IT is getting late now for planting trees and shrubs, and such work should certainly be completed this month. There are amongst our native trees and shrubs some very useful subjects and we might include those which are especially suited to the varied sections of the northern and central parts of the state. Garrya elliptica, Prunus ilicifolia, Berberis Californicum, Ceanothus (wild lilac), and Hosackia (wild broom) are only a few of a long list, however they will do well even in dry locations and are splendid shrubs. Among the trees we might mention Pinus sabiniana, P. ponderosa (yellow pine), P. insignis (Monterey pine), Sequoia sempervirens (Redwood tree), all beautiful conifers easily grown.

Roses

Complete the planting of all new roses and dig around the other existing plants. See that all climbers are tied in and deadwood cut out. This month a careful watch must be made for mildew and aphis, or green fly, which generally appear. It will be advisable to be prepared for the former by spraying the bushes with lime and sulphur solution. This acts as a preventive. Dusting with dry sulphur is also often adopted. For aphis use Aphine or "Black leaf 40" insecticides. A most useful sprayer to use is one known as "The Standard", used in conjunction with a bucket and is so far the best syringe style sprayer I have ever used.

Perennial Border

Complete the planting of this and see that it has been renovated thoroughly.

Annuals

A start may be made this month sowing the following in a well prepared border. It is, speaking generally, advisable to sow them where they are to flower, sowing the seed very thinly and covering lightly with sandy soil. As soon as they start to push through keep a lookout for slugs at night, as these pests love darkness better than day—their deeds are evil.

The following list will supply choice annuals for almost any situation: Antirrhinum, or snap-dragon, in variety tall and semi-dwarf types; alyssum, sweet, for carpeting beds or edging; also Lobelia, blue and white, and ageratum, Mauve Beauty, all useful for edging. Clarkia, Godetia, Californian poppy, Shirley poppy, Nemesia in variety; Linaria hybrids, scabiosa; petunia; mignonette; Nemophila, Lu-

FEDERAL DOUBLE CABLE BASE TIRES

The quality proof of a tire is in its service. And country driving is the supreme test.

Federal Tires are built with an exceptionally tough tread, which not only yields long service but gives greatest traction.

They are safe tires, too. For in the base are built four heavy steel cables of exceptional tensile strength. These cables hold the tire securely to the rim under all conditions. Yet it slips off easily when required.

Made in white Rugged and black Traffik tread and sold by leading dealers everywhere.

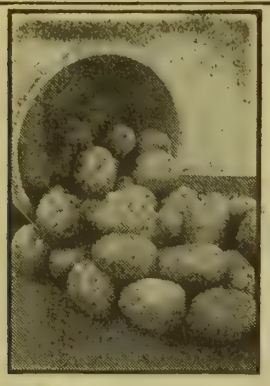
The Wonderful Radiance Rose



Sudan Grass

Califlora Brand

This is one of the best known forage crops used in the Southern and Middle Western states. It grows from 5 to 10 feet high and will produce four crops of hay under irrigation and usually two crops without irrigation. It thrives in the valley and foothill sections of California. It yields more to the acre than any forage crop we know of, and the quality of the hay is excellent. The stock of this seed is short and we anticipate higher prices in the near future.

BUY NOW—Lb 50c; 10 lbs. $4.00; 100 lbs. $35.00

ALFALFA SEED---Califlora Brand

This is our best grade of common Chilian Alfalfa seed. On every test this brand of Alfalfa seed has surpassed all others. We do not believe its equal can be had elsewhere. When buying this grade you are not paying for any weeds or chaff. It is the cheapest to plant because it is the best. Send for price and sample. We also offer superior stocks of GRIMM, HAIRY and SMOOTH PERUVIAN and TURKESTAN Alfalfa Seed.

SEED POTATOES

Splendid stock of OREGON GROWN American Wonder, Early Rose and Garnet Chili Seed Potatoes. These are all good early varieties. Write for prices and quantities desired.

THE ARNOTT ENGINE HARROW

This is the strongest engine harrow of its type sold on the Coast. Heavy axles, heavy discs. Built for service. Do not accept any imitation said to be the same. Only one genuine "ARNOTT" eight, nine and ten feet wide. Write or call for full information.

ARNOTT & CO., Inc., 112-18 S. Los Angeles St., Los Angeles

When writing advertisers, mention The Cultivator.

pins in variety; gypsophila elegans (Baby's Breath); Gilia ("Four o'Clock"), Mirabilis; Dianthus or pinks; African daisy or dimorphotheca; Centaurea imperialis and Cyanus (bachelor's button), Phlox drummondi; and Ten-Week stocks. The various pleasing shades of sweet peas may also be secured and the seed sown in especially prepared trenches which should be dug at least 18 to 24 inches deep and manure well mixed with the soil at the bottom. Soak the seed at least 24 hours before sowing, as some sweet pea varieties have a very hard seed coat. Sow thinly and watch these notes for detailed instructions later. For covering a fence these charming flowers will be found the very thing.

Gladiolus

Secure such varieties as the Bride and Peach Blossom, early flowering, and Mrs. Frances King. America, Peace, Afterglow, Princeps and Lemoins hybrids. Plant these three to six inches deep in well manured soil. They are very easily grown and make very valuable cut flowers.

Pansies

Plants of these may be purchased now and planted out. Get the best prize strains. You should plant them in fairly rich soil in a sunny situation where possible.

Plants for a Dry Spot

Many have such a spot to fill up and are often unable to supply water throughout the hot season. You will find that Gazania splendens, an orange daisy-like flower, Mesenbryanthemum roseum or the hardy calendula, or Pot Marigold, will prove to be what you have been looking for. Get them planted now.

Southern California

Written for California Cultivator

PLANT everything this month, that is, pretty nearly everything, including annuals of all kinds. March is a good month for planting, raking, fertilizing and overhauling the garden generally. It is also a good month for rejuvenating the lawn or planting anew. The lawn, by the way, is about the best ornamental which can be planted.

Sow alyssum, antirrhinum, calendula, calliopsis, cosmos, Shirley and native varieties of poppies, gaillardia, larkspur, mignonette and sweet peas in the open ground. Sow in seed boxes for later transplanting balsam, begonia, gloxinia, lobelia, pyrethrum, scabiosa, verbena, petunia, salvia, aster, celosia, centaurea, cobaea, hunnemania, marigold, salpiglossis, zinnia, in fact, one may go almost the range of seed planting with a reasonable assurance of success provided the tender seedlings are given regular and consistent care until well established, and after. March is one of our best months for the planting of tree seeds.

Among the bulbs, cannas, caladium, gladiolus, tuberose, dahlia, begonia and even iris may be planted though this latter should have been done some weeks ago as some of the very earliest are already blooming. Though perhaps a trifle late plant bulbs of Lilium auratum, L. speciosum, agapanthus and amaryllis.

Some wonderful improvements have been made in dahlias in the newer types. These newer sorts are expensive, but some of the cheaper varieties also afford some wonderful effects. Try for a change some of the dahlias this year.

Daffodils are in their glory. Be sure they are given plenty of water and a few handsful of commercial fertilizer help to bring them up to their best. The big Emperor and Empress, as well as some of the smaller ones, are wonders, and the gardener who has overlooked them this year should plan for some bulbs next fall.

Roses which have been resting during the season of cold weather will soon have a glory of bloom. Cut out the excess wood so that good thrifty shoots may give big, husky blossom stalks. Apply fertilizer, spade up and work about the roses.

Lemon verbena, poinsettias and like shrubs should be pruned very heavily since it is the new wood which supplies blossoms for the coming fall.

Feeding Ducks

We have 39 ducks, Indian Runners, six old ones, the others hatched in April and May, 1916. They have the run of a large alfalfa ranch and are fed some wheat, also bran and small quantity of milk. A few have laid since last fall but no more than six eggs in any one day. Now we would like to know what to do to make them lay. They are not very profitable at present.—Subscriber, Porterville.

Laying ducks need more animal food than the "small quantity of milk" you mention and their ration should be largely ground grain. B. Twining, one of the largest duck raisers in the country, feeds his breeders by this formula: Bran, one part; middlings, one part; low grade flour, one part; whole corn, one part; wheat, two parts; cornmeal, two parts; cut clover, four parts; beef scrap, from 12 to 18 per cent of the whole. Grit, sand and shell are added to the mash and the whole moistened till it is crumbly, not sloppy. This formula could be modified, I think, to fit the needs of California duck raisers by omitting the low grade flour and substituting alfalfa for the cut clover and cracked corn for whole. A simpler ration, and one which is recommended especially for Runners, consists of 50 per cent bran, 25 per cent corn meal, 15 per cent beef scrap, ten per cent sand. This is fed dry, but with plenty of clean water within reach, lest the birds choke. Once every day the birds have a meal of chopped greens. Some breeders feed nothing but greens and ground grains; others add cracked corn or wheat to the mash; others again feed the mash in the morning, greens at noon, and a handful of mixed grain at night. The main things to remember are that ducks must have considerable animal food if they are to lay, and that a large part of the ration must be ground grain, either wet or dry.—J. A. K.

Potash

What is potash chiefly made of and where is the best place to sell it?—Subscriber, Winchester.

Potassium carbonate is obtained from wood ashes, from seaweeds, from various mines and other sources, and may be sold today to almost any farmer in the United States because of the dearth of this valuable fertilizing ingredient. If one has a large quantity it is probable that any wholesale druggist or drug manufacturer would afford a market.

Ashes

Are wood ashes a good fertilizer for Irish potatoes?—Subscriber.

Ashes are especially rich in potash and contain a small quantity of phosphoric acid. They should be carefully saved and are especially beneficial to soil where potatoes are to be planted.

Market Onions

Please advise best variety of onions for market and kind of soil required, also best time of year to sow the seed. —Subscriber, Anaheim.

On the assumption that a mature onion is to be grown we would advise that the Australian Brown is the standard onion and we doubt not it would do well in your section.

Seedlessness of the Navel

Are there supposed to be exceptions to the seedless nature of Washington Navel oranges? The writer recently found several well-developed seeds in a navel orange.—Subscriber, Porterville.

Yes, the seedless navel quite often or at least occasionally, has fully developed seeds. Seeds found in navels entered for prize competition are considered sufficient cause for a cut on the score card. Some growers have been interested to see what these seeds would produce, but nothing startling has ever come from experiments along this line.

Burning off the "Slash." The "slash" (bark, undergrowth, tops, etc.) burns off, but the logs simply char slightly. Only Redwood can be logged this way.

The wood that resists fire

Fire, that bugbear of the farmer, has small terrors for the man who builds with California Redwood.

Made fire-resistant by nature — contains no pitch. Extremely slow to ignite, slow burning and easily extinguished.

California Redwood

Resists Rot and Fire

California Redwood also has wonderful endurance. Not affected by dry or wet rot—even when in the ground—or changes of temperature.

When properly seasoned, will not shrink, swell or warp. And is easily worked.

The ideal wood for all farm structures from henhouse to silo, barn or farmhouse.

Write us today for free booklet, "California Redwood on the Farm."

If your local lumber dealer does not carry Redwood in stock, send us his name, and we will arrange so he can easily get it for you.

There IS a Kerosene Tractor
It is Mogul 8-16

IN order to remove the last shadow of doubt about the ability of **Mogul 8-16** to operate successfully on kerosene, we now put into our warranty a guarantee that **Mogul 8-16 will do good, serviceable work at all loads, operating on common coal oil.**

That is our answer to critics and doubters—a **signed guarantee** to purchasers of Mogul 8-16. You can now buy a tractor **built** to operate on kerosene, that **does operate successfully** on kerosene, and that is **guaranteed** to do good, serviceable work on your farm, using kerosene for fuel.

Now it is up to you. Buy a guaranteed Mogul kerosene tractor and you get a machine that will do your work for about half the fuel cost of a gasoline tractor of the same power, and that will work faithfully for you through the rush seasons when you need reserve power.

Will you please send us your name and address, so that we can tell you in full detail **why** we can guarantee the kerosene burning feature of Mogul tractors. **Mogul 10-20** and **Mogul 12-25**—the larger Moguls—are also kerosene tractors.

Trespassing Stock

Please inform me regarding the law pertaining to trespassing livestock, whether a man is required to fence his property before he can claim damages. If this is required California is a generation or so behind other states in this respect and it would seem to be high time for our solons at Sacramento to devote their time to legislating on matters of a strictly civil nature.—Subscriber.

As has been answered many times in the Cultivator, the law of this state which was enacted when the live stock industry was its principal one states that unless the property is surrounded by a "substantial fence" injury by trespassing livestock cannot be set up as a basis for a damage claim. The estray law, however, permits empounding of any stock at large.

Amortization Tables

We have letter from Secretary W. A. Flannagan, of the federal farm loan board, regarding amortization tables which were inquired about by a subscriber in a former issue. Mr. Flannagan writes: "In response to your request I am enclosing you herewith copy of Circular No. 60 issued by the United States department of agriculture, which will give you detailed information how to determine the annual payments on loans at different rates of interest and for different periods of time, ranging from one to 40 years. Please see particularly page two of the circular."

Specifications for Silo

Please give specifications with items as to lumber necessary for resaw silo. —Subscriber.

See page 51 of the Cultivator for July 18, 1912.

Contagious Abortion

Is the serum treatment effective in combating contagious abortion? How long will the treatment protect the animal, if at all?—Subscriber, Los Angeles.

We know of no serum treatment for this trouble. About the only treatment is the use of preventive measures such as liberal use of disinfectants. More specific information may be had in an article in another column in this issue.

California's Convict-Built Roads

By Charles P. Stern, State Highway Commissioner

TWO years ago I undertook a state wide campaign of education paving the way for the use of convict labor for highway work. In these days of hysterical penology and sob-sister criminology, when professional ex-convicts are capitalizing and exploiting their shame from pulpit, press and platform, a sane man approaches the subject with reluctance, but I saw a great state need and a means to meet that need partially.

On the one hand was our mountain road problem in California. To the east and northeast of us lies a string of counties in and beyond the Sierra. They are loyal Californians, but for months they are shut off from the rest of the state by snow blocked mountain passes, month after month when there is no mail connection, no fresh meat in camp, no possibility of outside medical attention. And this is the region that should be made the pleasure ground of the nation and a tremendous financial asset to California. The mountain road needs of California have always been far in excess of her resources and for years to come this must be so. The last legislature was asked for over $2,000,000 for needed roads and had not a dollar to give.

On the other hand, behind the walls of Folsom and San Quentin, are 4000 men, outcasts from society, hopeless, a burden to the state. If you should study them as I have you would be struck as I was by their appalling youth. This penal problem is a problem of young men, men who have the greater part of their lives still to live as increasing assets or liabilities to the state. The average age of the prisoner is under 30; taken in multiples of five, 25 years would include the greatest number. Of eight men awaiting the gallows a few months ago, the oldest was 33, the next was 27, one was under 18, and their average age was under 23.

It seemed to me that if this liability of the state could be made a resource, to the benefit of both parties in interest, the convict and the state, a great good could be accomplished. I drafted a bill, simple but comprehensive. We met every character of objection fairly and without subterfuge. To the plea that we were going to take a job from a free man to give it to a convict, we answered that we proposed to do work whose character and situation were such that otherwise it could not be done at all. Our bill became a law. It provides for dual control; the board of prison directors directing the discipline and control of the men, the highway department supplying everything and directing the work. Close harmony and cooperation between these departments of the state have made possible the results achieved.

In September, 1915, we opened our first camp, going slowly on a "safety first" basis. We started with 30 men and have gradually added another hundred. They are carefully selected by the board of prison directors, both for trustworthiness and physical fitness. We house them in sanitary camps, clothe and feed them as we would free men, grant them as much personal freedom as they will not abuse. They work practically on an honor basis, being handled by three men without arms in each camp of 60, one guard acting as captain of the camp and the other two as subforemen on the work.

No man, be he free man or convict, works without incentive. To these men we give better living and working conditions, practical freedom, and the crowning incentive of one day's reduction in sentence for every two days of loyal and efficient work. The scheme is working beyond my fondest hopes. We are taking men soft from prison life, many of them never used to manual labor. We are supplying them with everything at the expense of the work and working them under bitter weather conditions. Our costs to date are 20 per cent under the lowest estimate and 50 per cent under what we have paid contractors for similar work in the same region.

TRACTOR ASSOCIATION ORGANIZED

On Saturday, February 17, representatives of all the big tractor manufacturing companies on the Pacific Coast and California representatives of most of the Eastern tractor manufacturers met at the Palace Hotel in San Francisco and organized the California Tractor & Implement Association.

Mr. H. A. Smith of the Joshua Hendy Iron Works was elected president of this organization; W. H. Gardner of the Yuba Construction Company, vice president, and G. M. Walker of the Holt Manufacturing Company, secretary and treasurer.

The chief purpose of the association is to organize and conduct a tractor

WHAT EVERY FARMER WANTS

Cheap and Efficient Transportation His Great Need—How It Can Best Be Assured

THE present situation of the railroads present two alternatives, efficient federal regulation or federal ownership.

The experience of other countries proves conclusively that government ownership of railroads is more costly and less efficient than the system of private ownership in this country. The railroads of the United States have the lowest freight rates, the smallest capitalization per mile, the highest operating efficiency and pay the highest wages of any railroads in the world.

High Rates on Government Roads

The charge for hauling a ton of freight one mile on the government owned roads of various countries and on the privately owned roads of the United States is shown in the following table:

	Average Freight rate per ton mile
Germany (Gov't Railways)	1.24 cent
France "	1.30 cent
Australia	
New South Wales "	1.59 cent
South Australia "	1.75 cent
Switzerland "	2.63 cent
Canada (Private ownership)	.76 cent
United States "	.73 cent

No railroad system under government ownership can show a record for cheapness and service approaching that of American Railroads under private ownership. What the railroad situation needs is the adoption of a system of national regulation that will encourage initiative and investment and enable the carriers to meet the growing requirements of American business.

Keep Railroads Out of Politics and Politics Out of the Railroads

It is to the interest of the railroads and the interest of the whole country that the railroads keep out of politics and that politics be kept out of their management.

Government ownership under our political system would make the control of the railroads a partisan issue at every election. It would bring political and economic disaster.

No man in the country stands to lose more by the adoption of a political system of railroad management than the farmer. None will profit more from efficient national regulation that will do away with the present conflicts and waste of local control and enable the railroads to make the extensions and improvements necessary to keep pace with the business progress of the nation.

We invite discussion of this question and shall be glad to answer questions and to supply information on request.

demonstration or tractor demonstrations in California similar to demonstrations of this sort that have been conducted in Southern California and throughout the Middle West. Membership in the association is open to tractor manufacturers, manufacturers of plows, harrows, scrapers, and other implements to be used with tractors, and representatives or jobbers of the above named classes of concerns.

The next meeting of this association is to be held the last Saturday in March, at which time definite steps will undoubtedly be taken towards the making of arrangements for the biggest tractor demonstration ever held west of the Rockies.

Bee Moths

Written for California Cultivator
By G. W. Bercaw

PROBABLY the most common visible enemy of the bee is what is termed the bee moth. It is not to be dreaded; is easily detected and gotten rid of. The bee moth is a twin sister to the common moths often found among clothing, etc. A good strong colony of bees is rarely ever bothered with them. Usually weak colonies, queenless colonies, etc., are their prey. They spin their cocoons among the combs, and the young feed on brood, wax, etc., found in the combs. Their destructive work proceeds very rapidly once they get a start. Stored combs oftentimes offer a good breeding place for them, but I am led to think that the natural heat produced by a colony of bees offers a better place for them than cold empty comb. Keep all colonies strong and aid the bees by destroying any traces of the moths found anywhere, and you will easily head them off. The best plan is to entirely destroy all combs in which moths have been working, either by burning or by extracting the wax from them, which of course will destroy the moths, and any eggs that might be contained in them. "Safety first" is a good rule. Some observers claim that our foul brood diseases are spread by the bee moth. This may or may not be the case, but take no unnecessary chances on it. In my inspection work I have never been able to trace its spread to this source.

TAKING HONEY FROM THE HIVE

Surplus honey should be taken from the supers before cold weather to avoid chilling the bees, but on warm days, even late in the fall, if the bees are still working, honey may be taken where for any reason it has not been removed earlier.

To remove surplus honey, says L. Haseman of the Missouri College of Agriculture, select a warm day and work rapidly as possible so as to avoid exposing the honey to robber bees. Also be careful to avoid spilling or smearing honey about the hive or ground as it always encourages robbing, the most undesirable trait of bees. Above all remember to remove only surplus honey and leave the brood chamber strictly alone.

The type of farming followed by a community often gives it wide advertising. Certain communities are known because they produce certain products. Persons wishing to purchase those products, will go to these communities to get them. A farmer within a community who is not following the same type of farming as his neighbors is losing an opportunity to profit by the community advertising.

TALKS ON Nitrogenous Fertilization

Number 10

DO you know that rice is the principal food of more than half the world's people? Over two million bushels was California's contribution to the 1915 crop. The yield, 66.7 bushels per acre, was twice that in Louisiana, where half the crop was grown.

The Department of Agriculture has published figures showing how rice culture has developed in California.

Year	Acreage	Bus. per Acre	Total prod. (bus.)	Avg. farm price	Total value
1910	100	33	3,300	$0.65	$ 2,000
1915	34,000	66.7	2,268,000	0.90	2,041,000

A ton of rice and its equivalent straw (4,000 pounds) removes 54 pounds of nitrogen from the soil, which, in California, tends naturally to nitrogen deficiency. Improved cultural methods, and possibly a scattering use of fertilizers, have helped overcome adverse conditions, but further increases depend largely upon the application in sufficient quantities of the most effective nitrogenous material.

SULPHATE OF AMMONIA

is definitely stated by investigators in India, Japan, Hawaii, Louisiana, etc., to be a superior form of nitrogen for irrigated rice. Dr. Kelley (Berkeley Experiment Station) found an application of 300 pounds per acre to give the largest net profit on soils similar in alkaline reaction to those of California.

Applied to small grains or hay crops, Sulphate of Ammonia gives equally attractive returns.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

One of the most picturesque ruins—not in Europe either—is shown on the cover page this week. It is the old mill, long since out of use and covered with vines, near St. Helena in Napa County.

FUMIGATING SACKS

Ontario is after a careless practice. Picking gangs have gone from orchard to orchard and carried—at least so it is thought—mealy bugs from orchard to orchard. Now the orchardists say that these sacks must be thoroughly fumigated before a new orchard is entered. Excellent suggestion.

ORANGE DAY

Every Californian should join in the campaign for Orange Day, March 10. The Orange Day committee will have prepared 100,000 souvenir post cards for Californians to mail East. Where one wishes these cards for mailing purposes he should write California Orange Day Committee, 517 Title Insurance Building, Los Angeles.

INSECTARY IN THE SOUTH

Horticultural Commissioner Hecke informs us that he has decided to locate a branch insectary at Alhambra in Los Angeles County. Commissioner Hecke and Harry Smith in charge of the state insectary at Sacramento have both been in California and have decided on the Alhambra location. Mr. Hecke writes that every effort will be made to extend the benefits of this branch of the commission's activities as rapidly as possible.

LEMONS UP

The renewed U-boat campaign has stopped practically all importations of Mediterranean lemons, and the highest February lemon prices have prevailed. From present indications these prices will continue. Unfortunately the spring cutting will be rather light because of the extreme cold.

PRE-PARED

Our article last week, "No Name", referring to the effort of the peach growers' association to secure a name for peaches from which the greater part of the peel has been removed has caused some little comment. One subscriber at Willows, T. T. Purkitt, appreciates the situation and suggests that California Peelless Peaches will answer the purpose and is a euphonious name which should be unobjectionable to the department. Another, A. D. Sinclair of San Luis Obispo, suggests Pre-pared.

We are not certain but

CALIFORNIA
PRE-PARED
PEACHES

would make a catchy catch phrase. This is the day of preparedness, and of course the association could get by with the claim that these are simply prepared.

PASS THE BILL

Californians wish development of the state's resources. It comes all too slowly. Dr. Mead and his commission have studied the question from all angles, not only in California, but nearly all other countries of the world have been called upon to give information as to best methods of land colonization.

To make a trial of some of the determinations of this commission there has been presented in the state legislature a bill which provides for the purchase of a body of land, say 10,000 acres, which may be subdivided and sold under conditions similar to those which have obtained in Australia and other countries which have found succes from this plan.

Without discussing the merits of the recommmendations of the commission we may say that we hope our state legislature will be big enough and broad enough to pass this bill and make the effort to answer the question, which is uppermost in many minds, as to how our state's development may be advanced most rapidly. Unfortunately some real estate promoters are objecting to this bill. This is one proof that there is possible advantage in the trial.

$18 A BARREL

George T. Powell of Ghent, New York, has spent most of his life in horticultural work, conducting farmers' institutes in New York and especially in producing apples. Not content simply with producing apples, he has produced good apples. As Dr. Coit suggested at the recent citrus growers' convention at San Bernardino there are two phases of fruit production, the one having to do with soil and its culture, with spraying, pruning and the many other cultural practices; the other phase having to do with picking, grading, packing and marketing. Mr. Powell learned that his business did not end with the first phase, with the production of ripened, high colored, uniformly sized, highest quality fruit.

The past year has been a year of high prices, but even then the prices Mr. Powell received for some of his fruit, some Cox Orange Pippins, sent to London are remarkable. The return to him was above $18 per barrel, and a cablegram was sent to him from London stating that this price paid was the highest ever. The apples sold at a shilling each. This particular fruit was shipped in boxes, and the size ran about 160 to the box. Even small off-sizes, averaging less than two inches in diameter, brought to the producer $2.50 per box. We believe the strongest point in connection with this remarkable marketing of fruits was made by Mr. Powell when he said that every apple in the box must conform to the standard.

READY FOR BUSINESS

It is probable that before the Cultivator reaches its readers the federal farm loan board will have appointed directors of the 12 federal land banks, that within a few days these banks will be ready to issue shares to applying farm loan associations and that during the next month or at least in the immediate future the local loan associations will be doing business with these banks. The board sends warning to farmers who wish to organize these associations to use care in the local organizations. Promotion of the federal farm loan associations has been encouraged by some in order to secure a salary as executive officer.

The farm loan act provides for the payment of a small salary to the secretary-treasurer of each farm loan association, and it also permits the payment of fees to members of the appraisal committee of each farm loan association, subject to the approval of the federal farm loan board. Each borrower under the farm loan act is required to provide an abstract of title, and the board has advised that farmers constituting an association join together, as individuals, in getting one attorney or abstractor to prepare these abstracts cooperatively so as to reduce the expense to a minimum. Complaints are now being made that certain individuals are organizing farm loan associations to get themselves elected secretary-treasurer at excessive salaries; that borrowers are being unnecessarily taxed for the payment of the appraisal committee and that in some instances attorneys and abstractors are using the system with a view of creating business for themselves.

PLANTING POTATOES

Every time the telephone rings in the Cultivator office these days it is almost an even gamble that there is to be an inquiry as to planting potatoes or which is the best variety of beans. Potatoes seem to have the call, however, for the greatest popularity. These inquiries come mostly from the town lot farmer, and the seedsmen are surely reaping a harvest. We doubt not most of them will be two bit customers; at the same time every backyard is to have a potato patch. How many of these potatoes will bring forth other potatoes is a question, but we do not think the producer of potatoes need consider it very seriously. But a word of warning may be in order, and that is for the farmer not to put all his potatoes in the same basket. Presumably the coming season will be a better one and the potato crop will be much greater than that of last year. However, we believe potatoes will still prove good property.

There are thousands of acres which should be planted to beans and to other staples. We would not say plant every foot of land in California, but we would say make every foot of land which is planted produce to the limit. To do this perfect culture, use of fertilizers, regulating water application, all are essential.

Speaking of beans, by the way, may we call attention to the fact that Limas a short time ago were selling at five cents, then six, later at seven, 7½, 8½, and now some are even passing the 10½ mark.

Agricultural News Notes of the Pacific Coast

Northern California

Colusa County's acreage in rice in 1917 is expected to be 32,000.

Napa County's Live Stock Association holds regular monthly meetings. W. L. Mitchell of Napa has been elected president for the coming year.

Experiments to test value of rice as hog feed are being tried out at the University Farm at Davis under the direction of Prof. J. I. Thompson.

Members of the Glenn County farm bureau have decided to market all butcher stock and grain sorghums through a market man to be employed by the bureau.

The record holder of the Gridley Cow Testing Association is Piebe Laura Inka De Kol, the property of J. H. Guill. Her month's butterfat production was 86.4 pounds.

Spirited opposition has developed among fruit growers of Eldorado County to the action of the county board of supervisors in abolishing the office of county horticultural commissioner.

Some of the counties which lost their exhibits in the fire which destroyed state fair buildings last year are reported to have declined exhibiting unless they are reimbursed for their losses.

Rice growers and millers are much dissatisfied with the marketing situation. W. B. Allison, former president of the Pacific Rice Growers' Association, says that only half the crop has been marketed.

George Clark, tester for the Gridley Cow Testing Association, reports that a Holstein, Piebe Laura, owned by J. H. Guill, Jr., of Chico, produced last month 86.4 pounds of butter fat. This makes her a record holder for the association.

The newly organized Central California Poultry Producers Association has signed contract with the San Francisco Wholesale Dairy and Produce Exchange for the entire output this season, with a guaranteed minimum price of 23½ cents per dozen for firsts.

Central California

The California Peach Growers' Association has patented a chemical process for removing the skins from peaches.

Sufficient acreage has been signed up for tomato growing next year in the Lodi district to assure the location of a cannery at that point.

The concrete bridge over Kings River, marking the completion of the state highway system from San Francisco into Visalia, is now open for use.

County Bee Inspector Hunarr of Monterey reports that the honey crop of that county amounts to $125,000, an increase of 25 per cent over last year.

A portion of the sugar beet acreage of the Chowchilla district is reported to have been damaged by cold weather in January. Some of it will have to be replanted.

The Danish Creamery Association has elected its directors for the coming year. They are: F. W. Hansen, A. Thiele, J. Poytress, N. H. Fugelsang and H. Graff.

Mariposa Island in the San Joaquin River is reported to have been sold for $80,000, the purchaser planning to put the entire island in alfalfa to provide feed for his herds of sheep.

Beet growers of Visalia are working hard to secure passage of a bill introduced into the legislature to appropriate $8000 for collection and distribution of parasites of the beet leaf hopper.

Supervisors of San Joaquin County are considering the necessity of meat inspection, as many hogs afflicted with hog cholera are reported to have been slaughtered and used for human consumption.

The first community auction sale of farmers and cattlemen of the Wasco farm bureau recently held at Wasco was attended by more than 500 people. The total receipts for the sale amounted to $4758.61.

Southern California

An experiment in rice growing is to be tried out on 240 acres near Brawley this season.

Lettuce growers of Brawley have been receiving two dollars per crate f.o.b. Brawley.

The Carpinteria Walnut Growers' Association reports sale of over $50,000 worth of nuts.

The San Antonio Fruit Growers' Association is again discussing the building of a cannery at Chino.

P. W. Damon of San Dimas has taken charge of the new citrus packing house at Fallbrook, San Diego County.

There is talk in San Diego of maintaining the beautiful exposition grounds as "the playground of the world."

The Southern Pacific Company announces that it is having built 2700 new refrigerator cars for handling fruit shipments.

Oranges from trees 60 years old will be shown at the National Orange Show next week. The trees are now growing in San Bernardino.

Fishermen have complained to the fish and game commission that the kelp cutting waste is ruining their fishing. A bill has been introduced in the legislature placing control of the kelp industry in the hands of the commission.

Bean growers of Ventura have endorsed the new form of contract of the California Lima Bean Browers Association without a dissenting vote. Under the new contract the grower will pay two cents per pound for all uncleaned beans and seed beans he fails to deliver.

Arlington poultrymen have signed a contract with a motor truckman to carry their eggs to Los Angeles and bring back empty cases for 20 cents a case. This will mean a saving over the former method of transportation of nine cents a case. The contract is to run for one year.

The Coast

A Salt River Valley, Arizona, farmer claims 60 bushels of corn to the acre.

An 11-year-old girl of Glendale, Arizona, took highest honors in the pig contest held by the University of Arizona.

The recent annual farmers' and housekeepers' week of the Arizona agricultural college at Tucson had a total registration of 250 as compared with 168 last year.

At the annual meeting of the Idaho-Oregon Fruit Growers' Association at Payette a general manager was elected in the person of A. J. Scherer to take charge of the business of the association the coming year.

A bounty law is proposed by the Arizona senate. The framers of the bill would pay $25 for each lobo wolf, mountain lion, puma or panther; one dollar for coyotes and five cents each for jack rabbits and gophers.

The Kennewick-Richland Marketing Union of Washington reports berry and potato growers signing up rapidly and that prospects are for the association handling a much larger proportion of the crop than last year.

The Colorado State Potato Growers' Association, which was organized one year ago, has carried out some very successful work, and at its recent annual meeting at Fort Collins made more extensive plans for the coming year.

At the recent Arizona state fair one of the most attractive features was the exhibit made by young people of the agricultural clubs. Erma Awrey, of the Fowler Canning Club, took prizes on best exhibit of canned fruits and vegetables, jellies and jams.

A plowing match was held at the experiment farm at Mesa, Arizona, Saturday, February 3, in which there were ten contestants. The first prize of $15 was awarded to Toy Oxford; second prize, ten dollars, to Bob Free, third prize of five dollars to W. W. Mitchell.

Olive Trees

50,000 Mission and Manzanillo
The two best commercial varieties

Splendid, well-grown stock, perfectly clean of all insect pests, with a splendid fibrous root action, in prime condition to plant.

Olives are one of the coming and most important of all economic fruits grown in California. There is a constantly increasing demand for California Ripe Olives, to say nothing about the value of the crop for the production of oil. They require but little attention, compared to other fruits; they grow with a minimum amount of water. Hilly land unsuited for ordinary fruiting crops, will suit them perfectly, and can be made not only productive, but highly remunerative.

The stock we offer is A-1 in every respect. If you are in the market for a large or small quantity, you will find the prices more than attractive. If you have some vacant land and are wondering what to plant it with, it will pay you to investigate the prices we can quote you on these trees. Sample trees may be seen at our Sales Department at Ninth and Olive. We can furnish them in the following sizes:

½ to ⅝-inch caliper.
⅝ to ¾-inch caliper.
¾ to 1-inch caliper.
1 to 1¼-inch caliper and over.

If not convenient to call, write us or telephone.

This "Warning Signal"

Insures proper speed on every NEW De Laval Cream Separator

NINE people out of ten turn the separator handle too slowly.

Thousands of tests with experienced separator operators show this to be the case.

Other tests made by the highest authorities have shown conclusively that there is a big cream loss when the cream separator is not turned fast enough.

You will avoid such a possible cream loss if you buy the New De Laval. The Bell Speed Indicator on the New De Laval is a "warning signal" that insures proper speed at all times. No matter who runs your De Laval, this "warning signal" will tell you when the speed is not right. You hear it, and do not need to see it. This one feature alone may easily save you the cost of a cream separator in the next few months.

But that is only one of the big advantages of the New De Laval. Other advantages are greater capacity, closer skimming and easier turning, simpler bowl construction, and easier washing.

If you haven't the spare cash right now, that need not stand in the way of your getting a New De Laval right away. We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at the time of purchase and the balance in several installments—so that your De Laval will actually pay for itself while you are using it and getting the benefit from it.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

Prevention of Abortion in Cattle

IN order to make immediately available throughout the state recent discoveries regarding infectious abortion and allied diseases of cattle, the college of agriculture of the University of California, in cooperation with the California State Veterinary Medical Association, recently held a practitioners' short course in veterinary medicine at the university farm, Davis. Seventy-five veterinarians attended the course. One of the chief features of the course was the demonstration by Dr. W. I. Williams, research professor of diseases of breeding cattle at Cornell University.

The success of his system of treating barrenness resulting from abortion disease has attracted the attention of veterinarians and stock owners throughout the county. The system requires special training and some of the California veterinarians are planning to go to Ithaca, New York, for further study and practice under Dr. Williams. In addition to the special operations taught by Dr. Williams he recommends a system of preventive hygiene which should be carried out by every owner of valuable cattle, and which he explained at a lecture before cattle breeders at Sacramento on December 26.

He stated that abortion is a disease so widely disseminated that few dairy or pure bred herds are free from the infection. The infection may even be present in cattle without the occurrence of abortions. When the virulence of the germs is high losses occur in the herd from abortion, sterility, retained afterbirth, or diseased ovaries, and they also cause diseases of newborn calves, such as calf scours, pneumonia, joint disease and similar complications. In infected herds not only the aborting cows but non-aborting cows, bulls and calves may harbor the infection, and calves and young heifers should be protected from infection. Heifers carrying the first calf are more liable to abort than older cows. The two periods when the germs of abortion infection are most liable to gain entrance to the offspring are at the time the heifer calf is born and at the time she is first served by the bull. The entrance of the germs at these times is especially liable to cause damage. In order to obviate as far as possible the infection, Professor Williams recommends the following procedure to all cattle owners having animals valuable enough to warrant the extra expense:

Before and after service irrigate the sheath of the bull with one-fourth per cent Lugel's solution. It is advisable to administer a vaginal douche of this solution an hour or two before service to cows which do not conceive at the first service. Dr. Williams has discovered that the use of this solution does not interfere in any way with conception. If the cow still fails to breed, enlist the services of a qualified veterinarian who by manipulating the ovaries and catheterizing the uterus may be able to get the cow into breeding condition.

When the cow has reached her 270th day of pregnancy or earlier, if calving seems probable, give her a thorough bath with warm water and soap, lathering the skin repeatedly until thoroughly clean. Rinse off the soap and water with a one per cent solution of compound solution of cresol. Place the cow in a clean, disinfected stall. After the bathing wash the tail, vulva, thighs and udder daily with warm compound cresol solution, one and a half to two per cent, and douche the vagina daily with one-fourth per cent Lugol's solution.

When the calf is born rub it dry and disinfect the stump of the navel cord. Do not tie it. Do not touch the navel stump with the hands. Fill a goblet or glass to the brim with 1-1000 corrosive sublimate solution, and having the calf held on its feet, push the goblet against the navel region so as to submerge the navel stump completely and keep it submerged for 15 minutes. (Corrosive sublimate tablets con be purchased of a size that one to one pint equals 1-1000.) Then dust the navel stump over heavily with a powder composed of equal parts of powdered alum and boric acid. Place the calf in a clean, dry, comfortable stall and keep it alone until two or three months old. Do not permit the calf to suck.

According to Dr. Williams, it is best in most cases to feed calves on boiled milk. Some very young calves do not thrive on boiled milk and when it does not appear practicable to boil the milk the following special precautions should be taken to protect the milk for the calf from infection:

Before drawing milk from the cow to feed the calf wash her vulva, tail, thighs and udder and douche the vagina according to the plan recommended prior to birth. The milker must first disinfect his hands and use a sterile pail. The first milk from each teat should be discarded. Repeat the washing of the vulva, tail, thighs and udder immediately before each milking. Repeat the vaginal douches daily until all discharges from the vulva have ceased. At eight or ten days of age nearly all calves may be safely placed on boiled milk. The milk which is boiled may be drawn from any economic source. In order to prevent scorching a large double boiler or water bath should be used to heat the milk.

When all discharges after calving have ceased, vaginal douching of cows may be stopped, though it would be well to continue the external washing of vulva, tail and udder daily in the interest of clean milk as well as of the general health of the herd. When abortion or retained afterbirth occurs each case should be handled individually by a skilled veterinarian and by the special treatment restored to health as promptly as possible. Much needless loss might be saved by owners of valuable pure bred cattle if the services of veterinarians skilled in the special work perfected by Dr. Williams were available. By monthly or quarterly veterinary examination of all the animals in a herd, cases of sterility will be discovered before it is too late to cure them and incurable or dangerous cases can be eliminated before they have done irreparable damage to the bull or other cows.

This does not mean, however, that all animals infected with abortion should be disposed of. As a matter of fact in herds in which abortions are occurring a cow that has aborted once or twice may be just as valuable for breeding as one that has not. Cows seldom abort more than two or three times. Cows that are not made sterile by abortion will in all probability resume normal reproduction. On the other hand, if they are removed to make way for fresh animals there is a possibility that the newcomers already are or soon will be infected and are more liable to abort than the old

Raise Your Calves on

Blatchford's Calf Meal

and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.

Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 5 Waukegan, Ill.

ones. The elimination of infected animals is, therefore, not to be recommended as a means of controlling the disease unless their value is not great enough to warrant the expense of treatment.

By keeping pregnant animals the disease will be brought to a standstill more quickly than if new susceptible material is continually added in their place. Some cows apparently become immune without aborting. It is the history of the disease in the great majority of herds that after reaching its height it gradually subsides of its own accord until only a few slips occur each year or it may disappear entirely. In herds where abortions have not occurred for several years, or at least only rarely, the owner should take particular pains to prevent its introduction. Every case of abortion should be regarded as infectious until proved otherwise.

For outbreaks of pneumonia and scours in calves Mr. Williams recommends the frequent use of enemas of physiological salt solution and the daily injection of liberal amounts of calf scour serum in addition to the special precautions to be taken at time of calving mentioned above.

WORMS IN SHEEP

Copper sulphate used as a drench has been found a satisfactory treatment for stomach worms and tapeworms in sheep, which sometimes cause considerable loss to sheep raisers. Digestive disturbances, malnutrition and general weakness are symptoms of these parasites. The sheep should not be fed for from eight to 20 hours before treatment is given. For a yearling sheep treatment consists in giving in the form of a drench, two ounces of a solution, made by dissolving an ounce of copper sulphate in two quarts of water. For a two-year-old sheep, three fluid ounces will be required.

ANOTHER CALIFORNIA RECORD

Mr. Taylor, manager of Mrs. Baldwin's Santa Anita Rancho, phones of another performance of the remarkable heifer, Valley Mead De Kol Walker, which now makes her another world beater 240 days from calving and as a senior two-year-old she produced in seven days 404.2 pounds of milk and 21.33 pounds of butter.

It's due to California climate—and breeding and feeding, and in fact several other things. But, it's done in California.

THE HARRIS SALE OF MODEL HEREFORDS

The annual sale of Model Herefords of Harris & Sons will be held in Sullivan County, Missouri, next week. Last year's sale was the supreme effort when some 60 odd head of bulls and females averaged $1247 per head.

We need hundreds of good registered bulls on our western ranges, probably need them more urgently than in any other section of the country, not necessarily the $10,000 kind but the big boned. vigorous, typey males that produce the desirable range beef. Good ones cannot be had any more for a song. The beef herd needs the high class sires just as much as does the dairy herd.

At the 1917 sale Harris & Sons will offer about 150 head of choice stock. The noted Repeater blood will predominate, but Gay Lad, Prince Perfection and Benjamin Wilton strains are frequently represented. In a long list of wonderful young bulls Gay Lad 40th 503718 stands at the top. This youngster was a sensation on the 1916 show circuit and is indeed noteworthy. He was the undefeated junior champion at all the principal shows. He is out of Miss Repeater 13th and was sired by Gay Lad 6th.

The breeder in the market either for show animals or herd headers will certainly have a rare opportunity to secure the best at this sale.

Are Your Cows a BURDEN?

Many cows are a constant drag on their owners when they could just as well be good producers—if properly handled.

Don't forget that your cows can get physically "off color" just as you sometimes do. Watch the milk yield; if it is going down without apparent reason, something is wrong with the cow. Overfeeding is likely to make the condition worse; she needs a medicine that will clear up and strengthen her organs of production.

Kow-Kure is making thousands of new friends among the best dairymen every year, because it supplies this great need. It is a cow *medicine*, pure and simple—not a food. It has great curative and tonic powers that immediately act upon the digestive and genital organs and enable the cow to thrive on her natural food. Kow-Kure has back of it twenty years of success in making backward cows profitable and in the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Lost Appetite, Bunches and other common ills.

You can buy Kow-Kure from the best feed dealers and druggists. Sold in 50c. and $1.00 packages.

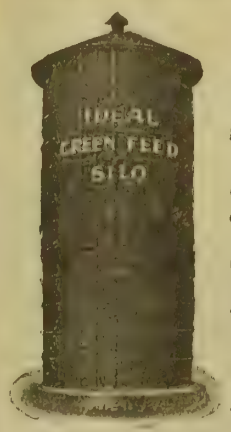
AN IDEAL GREEN FEED SILO



Insurance Against Drought

Now is the time to provide against shortage of green feed during the coming dry season.

The losses sustained by many dairymen last year could have been avoided if they had installed a silo early in the season.

Good Ensilage Increases the Milk Flow 25% and Reduces Feed Cost 15% to 20%

AN IDEAL GREEN FEED SILO will give you longer service, a better quality of silage and more profit on the investment than any cheap silo. This has been proven by the experience of many farmers who have tried both.

BETTER DESIGN, BEST MATERIALS, FINE WORKMANSHIP are embodied in IDEAL GREEN FEED SILOS.

Our complete Silo Catalog and Dairy Hand Book give valuable information on ensilage feeding. Send for them now.

State Dairy Cow Competition

The University Announces Results from Which We Quote as to Cows Which Produced Over 40 Pounds of Butter Fat During the Month of January

IN the following report the name of the owner is given first, then a list of the cows with the performance. The abreviations Gr., Ay., G., H., J. stand for grade, Ayrshire, Guernsy, Holstein and Jersey.

The first figures after the name of the cow indicate age. For instance, "Melba Gr. H. 7-7" means that Melba is a grade Holstein aged 7 years and 7 months. The next figure (27) indicates number of days in milk at beginning, the next number (1457.0) production of milk in pounds for the month, and the last two numbers percentage of fat (4.28) and pounds of fat (62.360) for the month.

Abbott, K. W.: Riverside Beauty II, H., 7—7, 24, 2035.9, 3.74, 76.143; Melba, Gr. H., 9, 27, 1457.0, 4.28, 62.360; Per, Gr. H., 7, 7, 1605.8, 3.70, 59.415; Rilla, Gr. H., 8, 79, 1661.6, 3.39, 56.328; Rosie, Gr. H., 7, 81, 1181.1, 4.46, 52.677; Ella, Gr. H., 7, 74, 1277.2, 4.09, 52.237; Emiline, Gr. H., 4—6, 54, 1444.6, 3.61, 52.150; Maria, Gr. H., 4—8, 51, 1388.8, 3.47, 48.191.

Bohnett Bros.: Murne, Gr., 5, 18, 1388.5, 5.35, 74.146; Spot, Gr., 6, 56, 1228.7, 5.81, 71.387; Reddie, Gr. Retained Afterbirth

When the membranes remain in the uterus of a cow and decompose, inflammation of the lining of the womb may be caused, and this, with the absorption into the blood of the products of putrefaction, lead to ill-health, emaciation, diminished milk supply, failure to breed, and often blood poisoning and death. HOOD FARM BREEDING POWDER causes the afterbirth to come away naturally in a few days, and thoroughly cleanses and disinfects the parts, leaving the cow in normal condition for breeding. Write for full information and prices, mentioning this paper.

This cow as a junior three-year-old made 26.60 pounds butter from 467.28 pounds milk.

McALISTER'S HOLSTEINS MAKING SOME FINE RECORDS

The McAlister herd of Holsteins has broken two existing state records for seven day butter fat production.

Just before the holidays Queen Pontiac Butter Boy made 22.64 pounds butter in seven days, and 86.07 pounds butter in 30 days, a state record for junior two-year-olds. Now comes another junior two-year-old, Segis Spring Farm Pontiac De Kol, who made 22.78 pounds butter in seven days. This heifer has the highest two-year-old record of all the daughters of Spring Farm Pontiac 6th. She started off at a world record gait giving at the rate of 31 pounds for the first three milkings, but she went off her feed during the test and fell back to 23 pounds. Undoubtedly this heifer will make a great record the next time she freshens.

The McAlisters have two other two-year old daughters of King Walker Segis, which just made better than 21 pounds butter in seven days, and averaged over 84 pounds butter for 30 days. One of these heifers gave 81 pounds milk in one day. Orndyke Duchess Korndyke is the McAlister entry in the state dairy cow competition. She recently made 26.35 pounds butter, 675 pounds milk in seven days, and 109.23 pounds butter from 2621.3 pounds milk in 30 days, giving as high as 101.6 pounds milk in one day. Her December milk record was the highest of any cow in the state contest. Maud Rachel Segis is another yearly test cow who is going along at a 25 pound butter, 95 pound milk gait. Allen Vail Daisy Walker at four years old made 28.31 pounds butter in seven days during February. Allenvail Pauline Walker became the new California champion junior three-year-old by making 26.42 pounds butter in seven days and 102.1 pounds in 30 days. Then her half sister, Allenvail Clothilde Walker, came right back and bettered the new record for seven days by making 26.60 pounds butter in seven days and 467.28 pounds milk.

Production of 5 grades, 56.605 pounds butter fat. Winner of McAlister & Sons' prize for January: Napa State Hospital: grade H., No. 67, 81.605 pounds butter fat.

Total entries to date, 160 cows. Average production for January, 1917 (98 cows), 1303 pounds milk, 5437 pounds fat (range, 104.47-23.9 lbs.).

Since the publication of Circular 153 of the college of agriculture last fall, five new prizes have been added to the list, making the total number of prizes to be awarded in the competition 93 and the approximate value of the cash and special prizes nearly $8000, viz.: For the highest average production of butter fat during ten consecutive months by four cows in a Stanislaus County herd; four prizes of $40, $30, $20 and $10, respectively, the first prize being open to pure-breds and grade cows, the others to grade and common cows only, offered by Modesto Creamery, Modesto, California. For the highest average production of butter fat by a herd in the Ferndale Cow-Testing Association that was not tested prior to January 1, 1917: A pure-bred Jersey bull calf out of a Register of Merit cow, offered by J. W. Coppini, Ferndale, California. All cows and heifers in milk six months or over must be included in arriving at the herd average.

ENDURANCE

THE hinges on the barn of the old homestead were hand-hammered by the blacksmith. The iron was slowly and carefully made and was free from most of the chemical impurities that cause rust. That is why those old iron hinges lasted to see many doors come and go.

"ARMCO" IRON CORRUGATED CULVERTS

like grandfather's barn door hinges, are made of iron so pure that they resist rust. They will outlast many ordinary metal culverts and, like the old hinges, will endure after the men who place them have passed away.

"Armco" Iron Culverts mean true economy in road building and upkeep; they represent prudence in the use of public funds. The trade-mark on every section is a pledge of "value received".

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing, and Formed Products, write the manufacturer in your vicinity, or

Improvement in Breeding Percherons

IN an address before the Kansas State Draft Horse Breeders' Association early in February of this year by Louis Aveline, French army horse inspector, he said:

"First, I must tell you about the horses I have seen in this country. Fourteen years ago I visited the United States, and for the last 28 months I have been back on inspection for my government. I found a great improvement in the breeding animals, and I was surprised at the quality of the horses. In Chicago, where I was at the International Show two months ago, I saw a class of aged Percheron horses quite extraordinary, the like of which I had not seen anywhere, not even in France."

Touching upon breeding in his own country Mr. Aveline said:

"In France, breeding is not conducted as it is in America. It is taken up by districts. In the south they raise the thoroughbred and Arabian breeds, in the east and north, the draft horses, in the northwest the coachers, in Le Perche, the Percheron horses. Each district has its specialty. In Le Perche you will not find, as in America, breeders keeping both stallions and mares. The man who sells to the exporters, and whom we shall call the stallioner, has not even the mares. The mares are on the little farmer's land. At breeding time, stallions, belonging precisely to the people who make a specialty to sell for export, are taken from one farm to another for the breeding which begins about February 1 and is kept on until June 25. A farmer with a 100 or 200-acre farm could do all his work with three or four mares. But he always has five or six, so that they do not work too much. The proportion of mares in foal, with this daily but not excessive work, is about 75 per cent. The colts then are born between February and June. The mare keeps on working up to the day of foaling. For about a week after the birth of the colt, the mare is kept with him in the stable. Then she goes back to work, being out about two hours in the morning and two hours in the afternoon. As soon as the colt is a few weeks old, and there comes a less rainy day, (I stated before that we have heavy rainfalls), they place the mare when she has no work to do, in the pasture with her colt, and as soon as the weather is a little better, they are left outside day and night. The colt is taken in only during the working hours of the mare. There is no time, no age to begin to feed the colt. When the mare is working, she has oats when she comes back from her work. The colt begins to eat by himself, and after he has reached a certain age the farmer takes advantage of the absence of the mother to give extra food to the colt, mostly oats. Since that time the colt is never without oats.

"Some farmers, and particularly the stallioners who prepare the horses for export, buy those foals, males only. Each big stallioner knows practically all the mares in the county. He knows by which stallion she has been served, he knows the line on the dam's and on the sire's side, and he buys those foals from the farmer. The price is pretty high. We pay sometimes as much as $400 for them, but they are taken to the stallioner's farm only when they are six months old, at weaning time. The stallioner has a large farm, mostly grass, the area of which varies from 400 to 500 acres. After the colts are weaned, they are placed in those pastures, by lots of about ten according to the size of the pasture. They are fed on oats, twice a day. The oats are given under a shed, but the colts are never locked up. They go about as they like. From that time, they stay outside day and night until after they are 30 months old, when they are sold for exportation.

"Before delivering his colt to the stallioner, the farmer must have it branded under the supervision of the Societe Hippique Percheronne. This brand is SP on the neck. At the time of branding the description of the colt is taken, and its pedigree made. All this is done under the care of the Societe Percheronne. * * * The maximum of registrations has reached about 7000 head counting both sexes per year. Each Percheron horse is then so branded before the age of six months, as a guarantee of its purity of blood. I insist on the fact that a very great importance should be given to this brand. It is a guarantee, it is a trade mark. The Societe Percheronne has imposed this brand in order to avoid all frauds."

Cactus for Feed

REGARDING the feeding of spineless cactus A. G. Lyle of Santa Clara County writes:

"I have the report of the college of agriculture of the University of California from July 1, 1915, to June 30, 1916. I have carefully gone over page 53, "Spineless Cactus for Milch Cows", and would like to ask how it would be possible to feed cows the way they are fed by the experiment station and make a living from them. Certainly if one had unlimited capital and was simply in the business for a pastime it might be an interesting experiment, but let us hear results of experiments where greatest profit is secured at least cost. I had the pleasure of visiting Davis some years ago and I certainly saw some fine stock, but I understood they all died that winter from overfeeding of alfalfa. I am not running down alfalfa. It is good feed but it has killed more cows than the professors of experiment stations ever saw. I am willing to make a test of feeding cactus and alfalfa, bran and barley as one ration against the ration they feed, and I will get 25 per cent more butter fat at less cost than they can produce."

We think the statement of Mr. Lyle regarding the fatal effects of alfalfa is somewhat overdrawn. Regarding cactus and its value, it is a succulent and has a certain value in the ration of any cow. Its analysis has been given in former Cultivators, and from it the intelligent feeder can judge as to how extensively he can feed. Where alfalfa is the basis of the ration we think the bran recommended in the above ration could be largely eliminated. At present prices of bran and barley their addition to the feed should be studied very closely. Regarding the experiment with spineless cactus made by the college of agriculture and referred to by Mr. Lyle, we quote herewith:

"Spineless Cactus for Milch Cows—A trial with spineless cactus for milch cows was conducted by Woll during

Soil and Water Analyses

Consultation on Agricultural Problems
Mark Walker, B.S., 211 W. First St., Los Angeles

the spring of 1916. Four grade Holstein cows were placed on the trial and fed cactus ad libitum, in place of Indian corn silage, which was fed prior to the cactus, the rations of the cows being otherwise unchanged, and consisting of alfalfa hay and mixed grain. Cactus was fed during four-week periods, but the amounts of this feed that the cows could be induced to eat were so small that the nutrients supplied formed only an insignificant part of the rations of the cows, viz., 8.3 pounds, 15.5 pounds, 7.3 pounds, and 5.9 pounds of cactus on the average per day for the four cows during the four weeks of the trial.

"The slabs fed had the following composition, according to the chemical analysis made by Jaffa: Water, 92.77 per cent; protein, .52 per cent; fat, .12 per cent; N-free extract, 4.43 per cent; fiber, .92 per cent; ash, 1.24 per cent.

The slabs were fed sliced and mixed with the grain feed, which consisted of barley, beet pulp, bran and cocoanut meal, one part each by weight. The amounts of cactus eaten by the cows during the last week of the trial did not materially differ from those eaten during the first week. The only way in which the amount could have been increased would have been to starve the cows into eating the feed, which would have deleteriously affected the milk flow both immediately and during the balance of the lactation period, a result which it was not considered advisable to bring about.

"A trial was also conducted with cactus vs. corn silage for fattening lambs. It was found in this trial that the corn silage produced 17 per cent more gain with ten per cent less feed than the cactus ration. It required about ten days to get the lambs to eat the cactus readily."

WINTER BUTTER MAKING

A little knowledge concerning butter making is something I've meant to offer from a long experience. I must beg to differ with the learned professor when he says, "Gather your churning, then put in buttermilk." That might work if you had enough to churn every few days. When the cream jar is well scalded and ready for the fresh cream is the best time to put in, say, one cup of buttermilk. In this way the slight sourness will enable it to ripen without turning bitter. No one could make butter out of it then. Another hint is to scald the churn. When it cools you can put in the cream and it won't chill. Yet another is to use a level teaspoon of baking soda to two gallons of cream when you start to churn. It breaks the globules and makes the work easier.

Scours in calves is easily cured by giving one or two raw eggs in the milk. It's never known to fail.—An Admirer of the Cultivator.

Wilts Masterpiece 210102, heading W. H. Waugh's herd of pure bred Berkshires, is a big, smooth animal weighing 650 pounds at 20 months and is still growing vigorously. He is splendidly put up and is strong in back, bone, feet and hams. He has a great heart girth and is unusually even from end to end. He is sired by the many times grand champion, Artful Masterpiece, and is out of Belle Wilts 35th, a California state fair first prize winner. He is a grandson of the noted Masterpiece 7700 and Lord Premier 50001 is both his grand and great grand sire.

H. P. Eakle Jr. reports sale of ten sows and a boar to J. Reath, of a bred sow to Roy Fowler and a boar to F. Beebe. Mr. Eakle has recently purchased a boar, Oregon Defender, bred by McKee Bros. of Versailles, Kentucky. He was sired by the original Defender, who was grand champion twice at the Chicago International.

Maurice Rucker has recently sold a bred gilt to F. M. Johnson.

Select Holsteins

DISPERSAL SALE

When H. I. Shaw, owner of Lakeside Dairy, Lakeside, San Diego County, California, selected his foundation stock several years ago, he was fortunate in choosing blood lines that have today become most famous in the Holstein-Friesian breed because of the tremendous milk and butter records made by members of the families represented. Now that Mr. Shaw has decided to sell his entire herd other men will have an opportunity to secure these good animals at public sale at their own price. We will sell his entire herd, consisting of

22 Head Registered Holstein-Friesian Cows and Heifers
2 Registered Holstein-Friesian Bulls
27 High Grade Holstein Cows and Heifers

Included in the lot are SEVEN DAUGHTERS OF A 32.45-POUND BULL. His sire is Pietertje Hengerveld Segis, 66 A.R.O. daughters, and he a son of King Segis, 87 A.R.O. daughters, and whose granddaughters include Segis Fayne Johanna, 50.68 pounds butter in 7 days, and the only cow in the world to produce 50 pounds butter in 7 days under official test; Fancher Farm Maxie, 46.84 pounds butter in 7 days, the world's champion senior 4-year-old; and Mabel Segis Korndyke, 40.32 pounds butter in 7 days, the world's champion junior 4 year old. The dam of this sire is a 32.45-pound daughter of Hengerveld De Kol, 116 A.R.O. daughters. All of these seven are from yearlings to 3-year-olds, and a nice bunch.

FIVE DAUGHTERS OF CAPTAIN JULIP ZAMPA, 9 A.R.O. daughters, and out of well bred dams.

TWO DAUGHTERS OF ARCADY WAYNE HENGERVELD, 24 A.R.O. daughters with records up to 28.08 pounds butter in 7 days.

A DAUGHTER OF JULIANA KING OF RIVERSIDE, 15 A.R.O. daughters, two above 1000 pounds butter in one year under mature age, and six others with yearly records from 711.57 to 808.82 pounds butter. He is also double grandsire of Aaggie Acme of Riverside 2nd, 25.36 pounds butter in 7 days, the present California champion. This cow is out of a 26.56-pound dam.

TWO HERD SIRES WILL BE SOLD. One a son of King Prilly Segis, son of King Segis and the famous foundation cow Prilly, and out of a dam who is by a good son of Sadie Vale Concordia's Paul De Kol.

The other is a young sire, well marked and a good individual, strongly bred in the blood of Colantha Johanna Lad on the sire's side, and out of a dam whose sire is a son of De Kol 2nd's Butter Boy 3d and Belle Korndyke, one of the greatest transmitting cows of the breed.

These cattle would look well in any herd, and there is no better blood to be had anywhere.

After the registered cattle are sold we will sell Mr. Shaw's herd of 27 high grade Holstein cows and heifers. They are an unusually choice lot and any dairyman looking for the profitable kind should be on hand sale day.

The sale will be held on the Thum Ranch, one-half mile east of Lakeside, and twenty miles east of San Diego, California, on Thursday, March 15, at 10 o'clock a. m. Lunch will be served at noon.

For catalog or other information address the sale managers.

GROWING POTASH

The embarrassing potash question has a possible solution in the kelp beds. To a certain extent potash has been produced from this source for many years. Only within the past two or three years has there been heavy production. It is now found that fields which were cut over only a few months ago to a depth of six feet under the surface of the water are again ready for cutting. Those in charge of one of the cutting barges working off the San Diego coast reported that beds cut over eight months ago are now being cut over for the second time, giving even larger tonnage than the first cutting. They are of the opinion that cutting the kelp is a benefit by "topping" the plants, relieving them of much storm tearing, which, of course, is mostly sustained near the surface, and compares it with trimming of certain shade trees which develop such great tops that they seldom live long, being blown over.

TIRE TROUBLE SOLVED

Fiberoid the wonderful treatment that DOES stop slow leaks and prevents punctures. $1.50 to $2.00 per tire will equip your car, treatment free until satisfied.

The Little King of Tractors

The Bean TrackPULL Six-horse Tractor combines giant strength with light weight and long traction. Just think of a tractor so small that it goes under the boughs of trees only 4 feet off the ground! Gets into corners where a team could never go, and works right up close to the trees and between anything that grows in rows only 7 feet apart—

That's what the Bean TrackPULL does. It will do your plowing, your cultivating and your discing, and then run stationary machinery when it is not working in the field.

IT ACTUALLY DOES THE WORK OF 6 HORSES ON WHAT IT WOULD COST YOU TO FEED ONE TEAM, AND YOU CAN WORK IT 24 HOURS A DAY IF YOU WANT TO.

The Bean TrackPULL is better than horses. It will do your heavy work in season and save you money by doing the man labor and by working harder and better in less time than horses take. It has full power on the turns as well as on the straight-away.

Pulling Three 10-Inch Bottoms

The Bean TrackPULL is ideal for soft soil and cultivating. It weighs only 2800 lbs. and pulls itself over the ground. This is a big advantage over a tractor with rear drive. It does not get stuck in soft places. You simply turn right or left, like a team and keep going. The Bean lays its own track on which it pulls. The wide track offers the least resistance, which means that the Bean is most economical to operate. The Bean TrackPULL costs only $975.00 and is the only tracklaying tractor selling for under $1800.

Best Construction Lasts Longest

The Bean TrackPULL Six-Horse Tractor is built in one size only—6 H. P. at drawbar and 10 H. P. at belt.

The motor is a Le Roi 4-cylinder vertical type—4-cycle. Equipped with:—Donaldson air clarifier, Bosch ignition Perfex-radiator-Water cooled with centrifugal pump and fan, combination pump and splash lubricating system.

Famous Hyatt roller bearings used in track wheel and sprocket also in track rollers. There are six New Departure ball bearings in the transmission, running in grease and all dust proof. Gears are steel. No differential or other complicated mechanism.

The Ideal Tractor for Orchard and Open Field Work

Prompt Deliveries in April

We are behind on orders and are working night and day. We are building a large addition to our plant to increase our capacity and will be able to make prompt shipment in April. You know the Bean Sprayer! The Bean TrackPULL Tractor is as good as the Bean Sprayer.

FROST PROTECTION

Continued from Page 247

shows that the equipment used so far has cost approximately $145 per acre to install ready for use. Table I shows the several items of this expense.

TABLE I

Per acre cost of present equipment:	
Pots	$ 80.00
Storage space	18.00
Small equipment	7.00
Oil to start operations	$ 40.00
Total	$145.00

With the present high cost of material this expense would be considerably increased. Certain of the very complete installations cost, even before war prices, as much as $200 per acre.

The same source of information indicates an annual maintenance cost of $26 per acre without reference to any of the operating expenses in time of firing. Table II shows the items in this expense.

TABLE II

Annual maintenance costs per acre:	
Interest $145 at 6 per cent	$ 8.70
Depreciation	11.55
Handling and care	5.75
Total	$26.00

Compared with some other forms of insurance this seems a high annual premium. If the value of the trees on an acre of orchard be considered as $1000, it will be seen that a rate of 2.6 per cent is required. With a yield of 260 packed boxes per acre the insurance cost would be ten cents per box; if the yield is increased to 520 packed boxes the cost would be only five cents per box. These figures represent the fixed charges only.

The actual operating charges vary within a large range with the season. In case of moderate cold 20 pots per acre may be lighted, which would burn in the neighborhood of 15 gallons of oil per acre per hour. If the severity of the cold is increased the hourly consumption may be increased to 75 gallons per acre. The average cost of oil is near four cents per gallon. The labor cost at time of firing varies between 40 cents and $1.00 per acre per hour. This gives a total operating cost of between $1.00 and $4.00 per acre hour. The extreme firing would not be necessary in actual practice except in the very severe freezes such as 1913. Table III gives the seasonal operating cost per acre with varying number of hours burning.

TABLE III

Per acre operating costs: Hrs.	5	10	15	20
Light firing at $1	$ 5.00	$10.00	$15.00	$20.00
Moderate firing at.. 2	10.00	20.00	30.00	40.00
Extreme firing at.. 4	20.00	40.00	60.00	80.00

The following typical cases came under the writer's observation this season:

1. Light firing, 6 hrs.		$6.00
Moderate firing, 2½ hrs.		5.00
Total		$11.00
Actual expense		$10.24
2. Light firing, 12 hrs.		$12.00
Moderate firing, 5 hrs.		10.00
Total		$22.00
Actual expense		$20.90
3. Light firing, 8 hrs.		$ 8.00
Actual expense		7.32
4. Light firing, 12 hrs.		$12.00
Moderate firing, 7 hrs.		14.00
Heavy firing, 2 hrs.		8.00
Total		$34.00
Actual expense		$33.68

The fixed charges of $26.00 per acre must be added to these costs to give the total expense.

(To be continued next week.)

NORWALK TIRES

These famous casings are invariably delivering mileage greatly in excess of their liberal guarantee of 7500 miles for Ford Sizes and 6000 miles for larger sizes. They are built by hand to withstand positively the most severe service. They represent the greatest value ever offered discriminating motorists. Give Norwalks a trial—you'll notice a conspicuous absence of tire trouble.

Swat the Cold Storage Man

Written for California Cultivator
By Jean A. Koethen

THERE is no better way of getting ahead of the cold storage man than by preserving one's own eggs. This would be too expensive for commercial egg ranches, but for the householder who has hens and wants a supply of eggs for fall and winter and for the small egg ranch which sells eggs at retail throughout the year it is invaluable. Here in our own little suburb I know a man who keeps 200 hens and who last spring put his entire surplus of eggs down in water glass. The result was that early in January when fresh eggs were selling at 50 cents per dozen, this man was selling water glass eggs for 35.

What one has done another can. Water glass eggs cannot be sold as fresh eggs, but they can be sold for cooking and often for the table, and wouldn't it be more profitable to put them away and sell for 35 cents in winter than to sell for 20 cents in the spring? This practice of preserving eggs at home is growing rapidly, and in some parts of the country, it is said, to the discomfiture of the middleman.

Water glass, or as it is technically known, sodium silicate, is a thick, mucilaginous liquid, which effectually closes the pores of the eggs which are placed in it, excluding the air, and preserving the contents for six months or longer. The length of time eggs can be kept depends partly on the condition of the eggs when they are placed in the water glass, and partly on the place in which they are kept. They keep longest in a cool, dark cellar, and the fresher and cleaner they are when preserved the better is the chance of their remaining fresh many months.

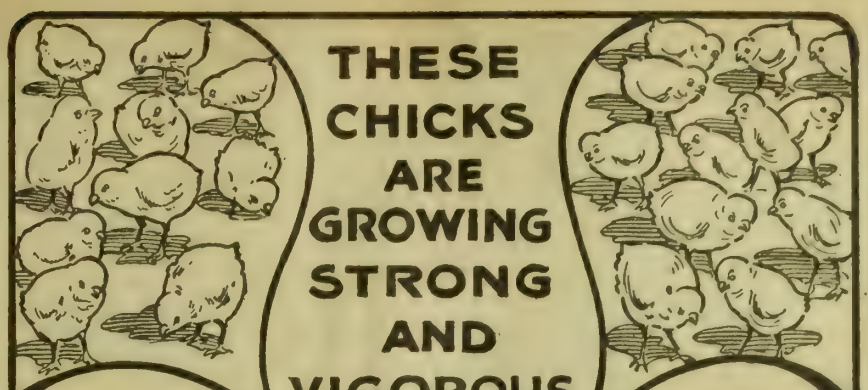
Water glass may be had from any druggist for $1.25 a gallon, and in large quantities could probably be had somewhat cheaper. It is diluted with nine parts water, that is, one gallon of water glass to ten gallons of water. The water should be boiled and allowed to cool before it is mixed with the water glass, and the mixture should be thoroughly stirred so that the water glass is evenly distributed through the ten gallons of the mixture. This mixture is kept in a large stone jar and the eggs immersed in it as soon as they are brought in each day. Keep the jar covered, and see that the liquid always covers the eggs.

Eggs that are to be preserved must be clean, fresh and infertile. Do not wash dirty eggs. Use them on the home table while they are still fresh. Washing removes the fine mucilaginous coating on the shell and lets air into the pores. When this has once happened decay is bound to follow.

Hens and pullets do best when they are kept in separate flocks and fed in different ways. Pullets demand more fattening food than hens. They do not store surplus fat as the hens do. The ration fed to hens should contain less starch than for pullets.

Pullets that are well grown by fall will lay more eggs during their first year of laying than they will as hens the following year. Therefore, pullets require more food than old hens.

The Tulare Cooperative Poultry Association transacted a total business for January of $6,389.47.



COULSON'S CHICK FOOD

You can always be sure that you are feeding the best that is possible when you feed COULSON'S CHICK FOOD, COULSON'S GROWING CHICK FOOD AND COULSON'S EGG FOOD.

These feeds add bone and muscle to the body and give great EGG PRODUCING QUALITIES. They have been on the market for years and our customers continue to order from year to year in ever increasing amounts.

Kale for Green Feed

Written for California Cultivator By Jean A. Koethen

GROWING green feed for 2000 hens and over 3000 chicks on half an acre of ground is an accomplishment wonderful enough under any circumstances, but not so wonderful as it might be when the green feed is kale and the irrigating water is administered intelligently and unstintedly.

I had been looking for some weeks for some one who had made a success with kale for poultry on a large scale, and so I was particularly glad to find on the poultry ranch of C. H. Hosford in Riverside just such a man. The kale raising was done in San Diego County, nearer the coast and in a somewhat more favorable location as regards moisture than our inland valleys, but the difference is simply one of a few inches more or less of irrigating water, for kale is a heavy drinker.

The man who knows all about kale is a Mr. Hunter who has recently come from San Diego County to take charge of the hatching and rearing of Mr. Hosford's chicks. I found him preparing his cultivator for the planting of the hundreds of kale plants which were growing in boxes in the sunny windows of the brooder house. "We planted half an acre to kale," said Mr. Hunter, "with chard between the rows for the young stock, and this fed our 2000 layers and 3600 chicks for a year. The kale was planted early in rows three feet apart and with 18 inches between the plants. Later on, after the weather had becom quite warm, we planted chard between the rows of kale—there is no use planting chard in cold weather, for it won't grow."

This kale was irrigated every six weeks, the water being run from a one-inch hydrant from 12 to 24 hours for each four rows. With such thorough irrigation the plants were soon brought to a height of six feet.

Kale is usually fed by simply pulling off the lower leaves and throwing them whole to the birds. It is a good plan to put part of them in a crock of water, for the leaves are unpalatable when wilted. It sometimes happens that birds which have been accustomed to alfalfa, lettuce or other more succulent greens, do not take readily to kale, but they soon learn to like it when other greens are denied, and it is one of the most wholesome of all green feeds. In Professor Jaffa's table the composition of thousand-headed kale is given as follows: water, 85.15 per cent; ash, 1.76 per cent; crude protein, 2.63 per cent; starch, sugar, etc., 8.49 per cent; crude fiber, 1.46 per cent; crude fat, .51 per cent. I have no figures for curly kale, which was raised by Mr. Hunter with such success, and which is generally raised in Southern California where kale is grown at all, but there is probably no great difference. The per cent of crude protein (2.63) is considerably less than that of alfalfa (4.94), but the per cent of crude fiber and of fat is also less, while that of ash, so desirable in maintaining the health of poultry, is a trifle more.

Kale, while it is a heavy drinker, cannot, so it is said, stand wet feet. Perhaps that is the secret of my raising it without irrigation on our gravelly soil. The soil on which it is grown must be well drained. The roots either seek moisture at great depths or extend out along the surface, according to the nature and depth of the soil.

Manure is almost as important as water, for kale is a gross feeder as well as a heavy drinker. For this reason it is particularly well adapted for poultry ranches, where there are always great quantities of manure to be disposed of. The soiled straw from the scratching pens should be dug into the ground before the plants are set, or better still, plowed in at the start. Then the fresh droppings from the houses may be spread on top of the ground as often as needed. A rank, almost tropical growth and dark green color of the leaves show that the plant has sufficient food. Plants carefully watered and fertilized have been known to reach a height of 14 feet. For feeding, the lower leaves are picked, just a few from each plant, leaving the upper and less fully developed to grow. Feeding may begin when the plant is two feet high or even less, but the picking must be carefully done, only the lower leaves being removed.

Legislation of Interest to Poultrymen

By C. A. Wilkins, Secretary California State Poultry Breeders Association.

FIVE bills have been introduced in the legislature of 1917 that are of interest to the poultry breeders of California. One in the assembly by Assemblyman Baldwin amends Section 599 of the penal code relating to the prevention of cruelty to birds or animals and providing for the seizure and disposition of property used or employed in connection therewith. This bill would apply to poultrymen and dealers in the transportation and storage of poultry.

Senate Bill No. 813 by Senator Slater of Sonoma is an act to provide for the holding of an annual state poultry show and appropriating money therefor. This bill was introduced at the request of the California State Poultry Breeders Association and is similar to bills which have been passed and enacted by the legislatures of Oregon, Missouri and other states. The state poultry show is designed to stimulate interest in breeding better poultry, and the results will be accomplished by holding the show in different localities each year, or until all such as have applied for the show have held it under the auspices of their local poultry association.

Senate Bill No. 462 by Senator Slater will regulate the manner of preparation or manufacture of egg products which are used in the preparation of

Wonderful Egg Producer
Any poultry raiser can easily double his profits by doubling the egg production of his hens. A scientific tonic has been discovered that revitalizes the flock and make hens work all the time. The tonic is called "More Eggs." Give your hens a few cents' worth of "More Eggs" and you will be amazed and delighted with results. A dollar's worth of "More Eggs" will double this year's production of eggs, so if you wish to try this great profit maker, write E. J. Reefer, poultry expert, 4262 Reefer Bldg., Kansas City, Mo., who will send you a season's supply of "More Eggs" Tonic for $1.00 (prepaid). So confident is Mr. Reefer of the results that a million dollar bank guarantees if you are not absolutely satisfied your dollar will be returned on request and the "More Eggs" costs you nothing. Send a dollar today or ask Mr. Reefer for his Free poultry book that tells the experience of a man who has made a fortune out of poultry.—Adv.

foods intended for human consumption. It provides that every person, firm, company or corporation engaged in the preparation or manufacture of canned eggs, dried eggs, frozen eggs, unshelled eggs, egg yolks, egg powder, egg albumen or any other egg product or egg by-product who, in the preparation or manufacture of such product, use what is commonly known and classified as "black," "white," "mixed," "sour rots," "green whites," "eggs with stuck yolks," "musty," "moldy eggs," "eggs containing blood rings," or any egg having a bad odor is guilty of a misdemeanor. The bill makes it the duty of the state board of health to enforce the provisions of this act. Conviction for violating any provisions of the act will be punished by imprisonment in the county jail for not more than six months or by a fine of not more than five hundred dollars or by both such fine and imprisonment.

Senate Bill No. 463 by Senator Slater will regulate the use of canned eggs, unshelled eggs, dried eggs, egg yolks, egg powder, frozen eggs or egg albumen in the manufacture of food products. It provides that any person, firm, company or corporation who prepares or serves, sells or offers for sale any food or drink, ingredients of which are in part composed of either canned eggs, dried eggs, frozen eggs, etc., before so doing must print on bills of fare or menu cards in black faced letters not less than one-eighth inch in height the words, "canned eggs used here" or "dried eggs used here," as the case may be. A sign must also be displayed in any public salesroom where such products are used, not less than six inches in height and three feet in length, bearing the words, "canned eggs used here," etc., and in letters not less than three inches in height and one-fourth inch in width upon a white ground. Penalty for violation is not more than six months imprisonment, or a fine of not more than two hundred and fifty dollars or both such fine and imprisonment. The state board of health will enforce this act.

Senate Bill No. 464, Senator Slater, will regulate the sale of eggs which have been in transit more than 31 days. This act would require stamping upon one end in black-faced letter not less than one-eighth inch in height, the word "storage."

Any person receiving eggs that have been produced at any place requiring 31 days or more to transport to the selling point, prior to the sale or offering for sale, must immediately report to the state board of health the number of eggs received, the date when received and the place where such eggs were produced and the name of person to whom sold. Six months imprisonment, a fine of two hundred dollars or both, may be imposed, upon conviction, for violation of any provision of the act.

Perfectly sound dry grain is the best for laying hens. Light-weight or shrivelled grains, or grains with an excess of husks, often lack the valuable element needed for egg production.

ARLINGTON POULTRYMEN, BUSINESSMEN

"POULTRYMEN of Arlington and Riverside," says the Arlington Times, "will obtain about $1000 more at least for their eggs this year than last because they will be transported to Los Angeles by motor truck instead of via express on a local passenger train or electric car. This is the statement of Arlington poultrymen.

"A contract was entered into Monday night between the truck committee of the Arlington Poultry Association and James Bird. The latter is to transport the eggs to Los Angeles and bring the empty cases back for 20 cents a case. This will mean a saving of nine cents on each case of eggs. The contract is to run a year.

"Mr. Bird will make collections of eggs and distribute the empty cases in the afternoon of each day. He leaves for Los Angeles at five o'clock each morning. During the next three months he will haul between 250 and 300 cases of eggs a week.

"The plan, as outlined in the contract, provides for the division of the Arlington Poultry ranches into three districts, and the route followed will enable Mr. Bird to take the eggs from each ranch twice a week. He will truck the product to Los Angeles every day, however, and under the contract agrees to haul the eggs to Los Angeles and return the cases to Arlington for 20 cents per case."

EGG LAYING RECORD

S. V. Newell of Bonsall writes: "In your issue of the 27th I find the following item. 'Two hundred and ninety hens in the sixth egg laying contest at Mountain Grove, Missouri, produced 2872 eggs in December, which is almost ten eggs each.' We can beat that all to pieces. We have 143 pullets. hatched on April 21 and May 1, 1916, that laid 2060 eggs in December; which is 14.4 per pullet. They are from Tom Hurley's White Leghorn stock, strictly a Bonsall district product."

Wheat, oats and barley may be sprouted, and this sprouting process has the effect of changing starch to a material similar to sugar, which seems to be partly pre-digested, and is thus quickly absorbed by the digestive organs. It is more satisfying and also greatly relished by the fowls. Less sprouted grain is required than the dry, therefore proving it to be, not only a more economical food but also more sure of satisfactory results.

The question of good healthy birds for breeders is as necessary in raising turkeys as in all branches of live stock breeding. We may keep our same stock for several years but must have hens and toms that are unrelated, which insures their vitality.

Sour milk should not be left out of the feed of growing or laying fowls, winter or summer, if it can be secured at any reasonable cost. It is usually much cheaper and easier to get on the farm than beef scrap or any other substitute and no common substitute except buttermilk will give as good results.

Save Your Chicks

That's your greatest problem. Little chicks die by thousands from *indigestion, diarrhoea, gapes, leg weakness, etc.* They need help—three-fourths of the loss can be avoided. Begin with the bowels—make the digestion right by using

Dr. Hess Poultry PAN-A-CE-A

Cures Gapes, Indigestion, Leg Weakness, etc.

Here are a few of the valuable ingredients in Pan-a-ce-a to meet the requirements of your poultry which I have just stated: *Nux Vomica*, a nerve tonic; *Carbonate of Lime*, a shell former; *Hyposulphite of Soda*, an internal antiseptic; *Quassia*, an appetizer; *Iron*, to enrich the blood, and other valuable ingredients, all well known and recommended by the highest medical and veterinary authorities.

TREES

Fruit Trees That Produce—You can't get good big crops of good fruit from poor trees. Elmer Bros.' trees produce because they are clean and healthy; strongly rooted; budded from trees of proven productiveness and are properly handled from the time they are put into the ground until they are dug and delivered to you. We grow everything worth while in the fruit line. It will pay you to communicate with us at once as this is the cheapest place to buy good trees. Write for free catalogue and prices. Elmer Bros.' Nursery, "The Nursery that Helped to Make Santa Clara Valley Famous", 82 S. Market St., San Jose, Cal.

For Sale — Washington and Thomson Navels, Valencias, Seedless Grapefruit, Eureka, Lisbon, Villa Franca and Seedless Lemon, Harman Avocados. Buds were selected from the best bearing trees and will yield bumper crops. Also 40,000 Mission and Manzanillo Olives. The above stock is growing in Rialto, Whittier, Glendora and Fallbrook. Budding cloth 30c yard, post paid. No frost damage. We solicit your patronage. Prompt replies to inquiries. Cyrus W. Wilhite, P. O. Box 154, Glendora, Cal. Phone 303.

By far the lowest priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator. The cost is only 3 cents per word per issue, with a minimum of 35 cents.

Olive Trees—Three years old this spring. Stock taken from a record-bearing grove. 2000 MISSIONS, 4000 MANZANILLOS; absolutely no finer nursery stock to be had in California. A portion of stock located near Redlands, the balance near Porterville. Price reasonable, mailed on request. J. A. Burke, 612 Black Building, Los Angeles, Cal.

I Have 300 Placentia Perfection Walnut trees; buds selected from an exceptionally heavy bearing orchard. They were interset in an orchard in 1915. Have decided to remove them and offer the lot at 75c each. Are in good growing condition, no die back the past winter. A. E. Nelsen, El Monte, Cal.

250,000 Home Grown Fruit Trees—Apples, pears, plums, peaches, apricots, figs, ornamentals, etc.; finest ever grown. Investigate the low prices of our first class stock before ordering elsewhere and save money. Inspection of nurseries invited. Orange County Nursery & Land Co., P. O. Box 235, Anaheim, Cal.

HOGS

Smith's Poland-Chinas—Sows and gilts bred to Joker, first prize boar at Wisconsin State Fair 1915. These sows and gilts were sired by Iowa Wonder, who is a son of the great A Wonder, the most celebrated Poland-China boar living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low, quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow, also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Send for Free Catalog—Finest ever issued. Tells of the famous Whitten Ranch money making strain of Big Type Poland-Chinas. Make greatest weight in shortest time at lowest cost, topping market at 225 lbs. in 6 months. 600 head, both sexes, all ages, reasonable prices. Satisfaction guaranteed. Ranch in Tulare County, but address owner, R. H. Whitten, 610B Security Bldg., Los Angeles.

Billiken Herd of Chester Whites—The big prize winners at the 1916 California state fair. The breed that makes money for the rancher and dairyman. Have 4 nice young service boars left and 20 young open gilts that will be bred as desired by buyer. Write for the Chester White booklet that tells all about them. C. B. Cunningham, Mills, Cal.

Poland-Chinas—Twenty good gilts and three 2-year-old sows for sale. Either sired by or bred to I. B. A. Wonder, reserve champion at P.P.I.E. A few good young boars ready for service, sired by I. B. A. Wonder. A fine lot of fall pigs. I please you or refund your money. W. A. Young, Lodi, Cal.

TURKEYS

GIANT BRONZE TURKEYS

Let me tell you how to make more money on turkeys. Large turkeys can be raised at practically the same cost as small ones. It is in the strain. By scientific cross-breeding I have developed a strain of turkeys which mature rapidly and attain unusually large size by holiday time. You can introduce some of this blood into your flock and make money by it the very first year. Gold Nugget strain wins again. At Pacific Coast largest shows, 1916, the California and Arizona State Fairs and San Diego, also the great Los Angeles Show 1917, eleven prizes, eleven entries. Stock and eggs from my flock should put you in the Giant Bronze Turkey lead in your locality. Toms for sale, also eggs. Write for circular. Raised on 320-acre farm. Address J. Will Blackman, 607 East Third St., Los Angeles, Cal.

PATENT ATTORNEYS

Patents that protect are secured through the PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "PATENTS".

The Hueneme local of the California Lima Bean Growers Association has endorsed the new contracts and expects to pool its entire 1917 crop through the state association.

Household Department

THE WISE FARMER

There was a man in our town
  And he was wondrous wise,
He knew that if he wanted crops
  He'd have to fertilize.

"It's nitrogen that makes things green,"
  Said this man of active brain;
"And potash makes the good strong straw,
  And phosphate plumps the grain.
But it's clearly wrong to waste plant food
  On a wet and soggy field;
I'll surely have to put in drains
  If I'd increase the yield.

"And after I have drained the land
  I must plow it deep all over;
And even then I'll not succeed
  Unless it will grow clover.
Now acid soils will not produce
  A clover sod that's prime;
So if I have a sour soil,
  I'll have to put on lime.

"And after doing all these things,
  To make success more sure,
I'll try my very best to keep
  From wasting the manure.
So I'll drain, and lime, and cultivate.
  With all that that implies;
And when I've done that thoroughly
  I'll manure and fertilize."

—Alfred Vivian.

A GARDEN STORY

Written for California Cultivator
By Doris Woodworth

THE Millers had come from the city with lots of love for the country and bought a small ranch, with good soil, in a small valley. They did not have a great deal of money. When they had bought the necessary stock and farm implements they had a small debt on their ranch, but they were young and ambitious and determined to make the ranch pay.

Mr. Miller wanted to put all their time and money into such things as would bring money back, and Mrs. Miller wanted to plant ornamental trees and shrubs around the house and have flowers to beautify the place. They discussed it from every side until he saw it would give her so much pleasure—and she would have so few pleasures that she had been accustomed to—that he consented to help her if it didn't cost much.

They first laid out a nice driveway with a sweeping curve around the side of the house to the barn, and he hauled gravel from a nearby creek to make it. They put a lawn in front of the house, and he decided that was enough. She didn't say anything but

Let the Wife Do It
It's easy with good tools for the wife to grow a good garden of her own.

she was determined to complete the picture she had in mind, so she went around to all her neighbors and asked for slips from all the different kinds of shrubs she could get, and planted a border on one side of the yard, with some of the old fashioned perennials in front, and such plants that when established would take very little care, for she knew in the busy time of the year she wouldn't have much time to give them. She sent cards out and got seed catalogues from different seed firms she saw advertised in the papers, and these were a great help to her. She grew some fine California pepper trees from seed. Back of the house she planted weeping willow trees that grew from little whips she had broken from a tree by the roadside on her way home from town.

Every year she planted a few trees in some out of the way, unused place.

One year hard times came and everything they had to sell was cheap. Their little boy was brought home from school with an injured eye. Their home doctor did all he could for them, but he could not see. He had to be taken to the city for an operation. They felt that they must give the boy every chance to save his sight, but they had no money, and, owing to the hard times, the banks were lending very little money on real estate.

With very gloomy faces they asked the president of the bank for a loan. He said, "As you know we are not lending much money on ranches now, but as your place is one of the show places of the valley I will see what I can do. One of the directors was telling me the other day that when he has company he always drives them past your place. It is like a picture you see of country homes. That's a fine background of trees for the green and flowers in front. I shall never forget going past there last spring when that lilac hedge was in bloom." He gave them the loan and wished them success with the boy.

Mr. Miller had a very thoughtful look on his face all the way home, and when he got in sight of the ranch he took a long look. He had been so busy and not being interested in ornamental trees he had not noticed how quickly those trees had grown up, and he

Bursting buds,
Shedding duds,
Setting spuds,
Spring.

Powerplus—the Master of the Steep Hills

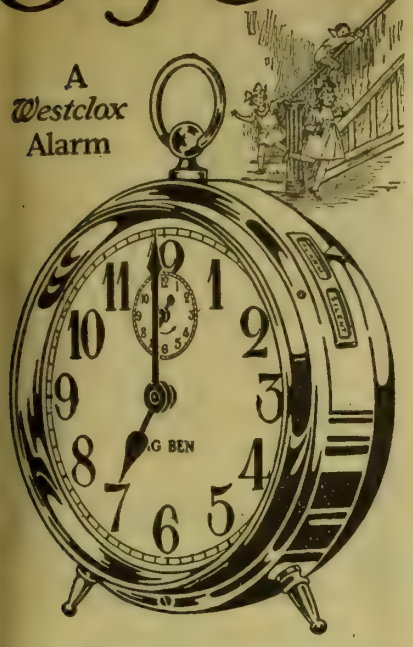
Big Ben

A Westclox Alarm



SEVEN A. M.—BIG BEN at his best—opening little folks' eyes—there's a race to hush him—a pillow battle—merry laughter—and mother to tidy the kiddies for school.

For the rising generation there's no better get-up. Big Ben's little men bubble health and cheer, and they feel as big as Daddy with a clock all their own.

He gets 'em to school long before the last gong and this habit lingers when the children grow up.

You'll like Big Ben face to face. He's seven inches tall, spunky, neighborly—downright good.

At your jeweler's, $2.50 in the United States, $3.50 in Canada. Sent prepaid on receipt of price if your jeweler doesn't stock him.

Those who do not read the advertisements in the California Cultivator will miss a lot of useful information.

said, "That was a good investment for us today, Mary." She did not answer but she had a look on her face that said, "I told you so."

You never put a single improvement on your property, but it pays in the end, no matter how great or how small it may be.

MY GARDEN IN THE IMPERIAL VALLEY

Written for California Cultivator
By Mrs. John Norton

MY garden in the Imperial Valley has reached the interesting stage where fresh vegetables may be picked for the table without appreciably diminishing the supply.

Though conditions here invite vegetable growing, and it is done on a large scale by market gardeners, comparatively few ranchers or town dwellers have their own kitchen gardens, and I have been particularly interested in demonstrating that a small garden may be made to pay. There is much satisfaction in supplying my vegetable-loving family with my own crisp lettuce and radishes, succulent greens, and peas that are sugar sweet, but greater than this is the benefit that has come to me from the work in the open air among the young growing things.

The garden plot is approximately 40 by 60 feet, and in it I am experimenting with a dozen or more varieties of vegetables. Peas of the Stratagem and Yorkshire Hero variety, planted in November, are in bearing, and the vines are covered with an abundance of bloom that promises a heavy yield later. Successive plantings of New York Head lettuce and White Icicle radishes have proved satisfactory. Beets have been quick to respond to the care given them, and carrots, turnips and cabbages are thriving beyond my expectations. White Bermuda onion seed, planted in October and November, has given me a quantity of small green onions for the table, besides furnishing enough for transplanting to grow the mature onions. These I expect will be ready to harvest in May and June.

My hot-bed promises a good supply of eggplants, tomatoes and sweet potatoes.

It is my plan to can the surplus peas or other vegetables I may have which are suitable for canning.

Each of my 20 rows is numbered and divided into sections for successive plantings. Numbered and lettered stakes mark the divisions. In my garden account book I have a complete diagram of the garden, with the date of each planting. This shows at a glance the record of every row. My rule has been to make frequent small plantings to lengthen the season for each vegetable as much as possible. In planning my garden, special attention was paid to securing proper drainage. This is of greatest importance.

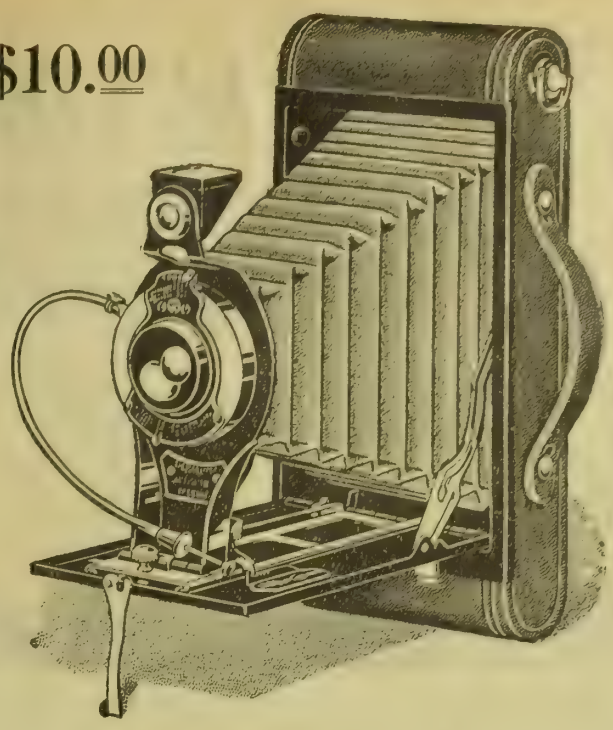
The seasonable gardening advice in the California Cultivator has proved most useful, and a careful study of California Vegetables, has saved me many discouragements. Last year's gardening, which was less systematically done, also taught me much.

The work was done principally in the glorious early morning hours with the larks and mocking birds singing a gay chorus about me.

Tired muscles meant rested nerves, and the exchange was gladly made. It interested me to see the spectacular manner in which my beans made their appearance in the world, and the countless little daily happenings of my garden were watched with the keenest pleasure.

My garden has paid me many times over for the effort it has cost.

$10.00



The New Model 3A BROWNIE

Here is a new camera for pictures of the post card size, (3¼ x 5½ inches). Manufactured under experienced superintendents by skilled mechanics with whom honest workmanship has become a habit, it has quality. Designed by the men who have helped to simplify photography, manufactured in the largest, best equipped and best organized camera factory in the world it has been possible, through quantity production combined with high efficiency, to produce this camera of real quality at a low price.

It has the new Brownie Ball Bearing shutter, with cable release, having both time and "bulb" actions and snap-shot speeds of 1/25, 1/50 and 1/100 of a second and is equipped with Kodak Autotime Scale as an aid to correct exposure.

Loads in daylight with ten, six or two exposure cartridges, has automatic focusing lock, reversible finder, two tripod sockets, genuine leather bellows, is constructed of metal throughout and is covered with a durable and attractive imitation leather of the finest quality. With its black enamel fittings it is a handsome as well as an efficient camera.

It is autographic, of course, all of the folding Brownies and folding Kodaks now incorporate this valuable feature by which you can date and title each negative *at the time of exposure.*

THE PRICE.

No. 3A Folding Autographic Brownie, meniscus achromatic lens, $10.00

Worn Out Soils Made Productive

by using

Hauser's Organic Fertilizers

Science and practice both indicate that Nitrogen and Phosphoric Acid are necessary to produce the best results from the Citrus Orchards, and these two essentials are most prominent in organic fertilizer. Hauser's Organic Fertilizer is a concentrated soil builder and fruit producer. Put back into the soil at least a portion of the natural elements the orchard has taken out.

Home Products

Send for booklet "Good Reasons," tells you why "Natural Fertilizers" fertilize and return you many times the money spent for this unexcelled plant and tree food.

BLASTING Made my trees grow twice as fast

Three-year cherry trees, same size when planted, in orchard of Herman H. Smidt, R3, Oregon City, Ore. That at left in soil blasted with Eureka Stumping Powder; that at right in dug hole. Illustrations reproduced from photographs taken February 14, 1916.

"The trees that I planted in blasted ground show a growth of 75 to 100 per cent. over the trees that were planted in ground not blasted," says Mr. Smidt. "They also appear healthier and more satisfactory in every way. I have just bought 1,100 more prune trees and would not think of planting them without preparing the ground with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

Hundreds of fruit growers have found, like Mr. Smidt, that the Giant Farm Powders—Eureka Stumping or Giant Stumping—are the proper explosives to use in tree planting. They pulverize the soil for several feet in every direction, instead of caking and packing or throwing it high in the air.

Be sure your dealer supplies you with the *genuine* Giant Powders and blasting supplies, made especially for Pacific Coast conditions. If you do not know where to get them, we will see that you are supplied.

Five Valuable Books FREE We issue five valuable illustrated books—on Tree Planting, Stump Blasting, Boulder Blasting and Ditch Blasting. Mark on the coupon the books that you prefer.

FARM LOAN QUESTIONS ANSWERED

Continued from Page 243

merely to cover the interest and amortization payments, called the installments, as well as the deposits likely to be in the hands of the secretary-treasurer at any one time.

What is the judgment of the farm loan board as to compensation for the loan committee?

This depends so much on the size of the association that no fixed rule can be made. Since this is a cooperative banking system the farm loan board desires that the work as far as possible be done without expense. The board believes that in a small association it will not be necessary to pay the loan committee any fees. The board believes that in very few cases will it be necessary to pay the loan committee more than actual expenses.

What is the judgment of the farm loan board as to the compensation to be paid the secretary-treasurer?

This also depends so much upon his relative duties as fixed by the size of the association that it is difficult to name an amount. This compensation should be based upon the time actually required to perform the work of the association.

May one man, by owning two pieces of land, become a member of two associations and borrow in excess of $10,000?

He may become a member of two associations, but the total amount of his loans may not exceed $10,000.

May an association operate across state lines even if both states are in the same bank district?

No, no association may designate territory in two states in which loans can be made.

In a general way what sort of abstracts will be required? Must they be prepared by bonded abstractors, or is this a matter for the judgment of the land bank officials?

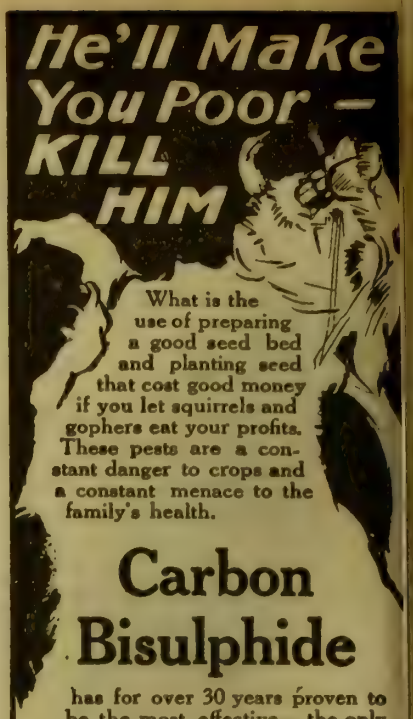
It is a matter for the federal land banks to determine. Any abstract of title sanctioned by ordinary sound business usage in the community will be sufficient under this act. The federal land banks will recognize any system of title registration approved by the law of the state in which the land is located.

DECIDUOUS EXPERIMENT STATION

President Leonard Coates of the California Nurserymen's Association sends us a letter urging support of the bill proposing establishment of a deciduous fruit experiment station in California. He writes:

"There has sprung up in the past month an organized effort to have appropriated by our state legislature, out of any state funds that may be available, a sufficient sum of money for the establishment of a deciduous fruit experiment station (to be located at some point in California best suited for experimental and research work) in relation to deciduous fruits. The movement has been inaugurated after a careful consideration of the necessity and practicability of such an institution, and the equity of the use of state money for the purpose, in the light of the importance of deciduous fruit growing as compared with other branches of California agriculture.

"Will you write your representatives at Sacramento at once, just a line, urging them to support a bill for this purpose? Please act at once: a deciduous fruit experiment station is badly needed."



What is the use of preparing a good seed bed and planting seed that cost good money if you let squirrels and gophers eat your profits. These pests are a constant danger to crops and a constant menace to the family's health.

Carbon Bisulphide

has for over 30 years proven to be the most effective—the only sure killer of squirrels, gophers, rats, prairie dogs, ants, moles, yellow jackets, moths, weevils, lice, etc. It is easy and safe to use.

Citrus Fruit Market

LOS ANGELES, Feb. 28, 1917.

Navels are selling a little better in the Eastern market, except in St. Louis, where a large supply of Floridas has brought down the price. Lemons are selling up to $4.50 in Philadelphia. Large size navels are meeting very good demand.

Shipments

Shipments of oranges from Southern California since November 1, 1916, 8358 cars, lemons 1849, total 10,407; to same date last year, oranges 7565, lemons 1863, total 9428. From Central California to date this season, oranges 4030, lemons 155, total 4585; to same date last year, oranges 4158, lemons 138, total 4323. From Northern California to date this season, oranges 842 cars; last year 609.

FROM THE AUCTION

February 21

New York: 15 cars nav., $2.10@3.45; 1 car lem., $3.45@3.85.

Boston: 11 cars nav., $1.80@3.20; lem., $3.10@3.70.

Philadelphia: Market higher, 8 cars nav., $2.00@2.90; lem., $3.10@4.00.

St. Louis: 7 cars, nav., $2.00@2.40; lem., $2.25@3.25.

Pittsburg: 10 cars, good demand. Oranges, $1.25@3.15; lem., $2.85@3.40.

Cleveland: 6 cars, nav., $2.05@3.25.

Cincinnati: 4 cars, nav., $1.90@2.70; lem., $2.35@3.05.

February 23

New York: 17 cars nav., 2 mixed bloods and tang., 2 lem. Fy. nav. high on large sizes. Bloods, $1.70@1.80; tang., $2.15; lem., $3.65@4.00.

Cleveland: 3 cars, nav., $2.25@2.70.

Boston: 10 cars, nav., $2.50@3.25; lem., $3.25@3.70.

St. Louis: 6 cars, nav., $1.60@2.30, lem., $3.15@3.50.

February 26

New York: 27 nav., $2.30@3.70; 7 lem., $3.05@3.80.

Pittsburg: Nav., $2.10@2.20; lem., $3.25 @3.45.

St. Louis: 10 cars, nav. slow account Floridas on market; nav., $1.40@2.25.

Cleveland: 5 cars, nav., $1.90@3.00.

Cincinnati: Three cars, nav., $2.55@2.95; lem., $2.80@3.10.

Oakland Sensible Six

"Sturdy as the Oak"

Satisfaction

There's a lot of *solid* satisfaction waiting for you in the purchase of an *Oakland "Sensible Six."*

From the first time you ride in it, you'll find the *Oakland* really "sensible" in power, comfort, ease of handling, and operating cost.

Its valve-in-head motor delivers full 41 h. p. at 2500 r. p. m.—one h. p. for every 53 pounds of car weight.

Its big oversize tires, 32x4; long supple springs, 51 inches in rear; wide seats and ample leg room, —mean *comfort* over any roads.

Its *sensible* weight, 2150 pounds, assures fuel and tire economy.

Its excellent finish, real leather upholstery, beauty and high class equipment stamp it a quality car at a *sensible* price—$875.

Oakland Eight—$1585—is a big luxurious 73 h. p., 7-passenger touring car for those who demand the utmost in power, speed and luxury.

127-inch Wheelbase

How Mitchells Differ

Because of What John W. Bate Has Done

Hundreds of Extras

Factory efficiency has been made a fine art in this plant. John W. Bate, our efficiency engineer, has spent millions to attain it.

This entire plant, covering 45 acres, was built and equipped to secure it. Now our new body plant completes it. We urge you to learn where these tremendous savings show in extra value.

For a Lifetime Car

Part of this saving pays for 100 per cent over-strength. Our margin of safety used to be 50 per cent. It has now been doubled.

Steering parts, gears, axles, etc., are made oversize. Our rear springs are built so that, in two years, not a single spring has broken.

Over 440 parts are built of toughened steel. Parts which get a major strain are built of Chrome-Vanadium. The steel in Mitchells costs us up to 15 cents per pound. And we do not skimp on weight.

The result is safety, freedom from repairs and troubles. And a car which probably will serve men for a lifetime. Time will prove, we believe, that this double strength is worth half the price of the car.

$4,000,000 in Extras

There are 31 extra features in Mitchells, most of them exclusive. On this year's output these extras cost us about $4,000,000.

They are things like a power tire pump, an easy control, a ball-bearing steering gear, engine primer on the dashboard, a light in the tonneau, a locked compartment, etc.

Every one is a wanted feature. Yet they are impossible, at a modest price, without Mitchell factory efficiency.

Extras in Luxury

The Mitchell has long been considered by experts one of the handsomest cars on the street. The output is largely sold in metropolitan centers.

Yet this year we have added 24 per cent to the cost of finish, upholstery and trimming. We are giving you heat-fixed finish, extra-grade leather, and scores of new dainty touches.

TWO SIZES

Mitchell —a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.

Price $1460, f. o. b. Racine

Mitchell Junior —a 5-passenger Six on similar lines, with 120-inch wheelbase. A 40-horsepower motor—¼-inch smaller bore than larger Mitchell.

Price $1150, f. o. b. Racine

Also all styles of enclosed and convertible bodies. Also demountable tops.

All this results from another economy. We now occupy our new body plant. All Mitchell bodies, open and closed, are built here now, under Bate efficiency methods. And this added luxury clearly shows the result.

What So Important?

What else is so important?

Extra values like these, without extra price, come only through efficiency. Under other methods, all these values are wasted in the shop.

Mitchell stands unique among fine cars in respect to efficiency. For a dozen years John W. Bate has worked here to attain it. Go to your Mitchell dealer and see the results. Compare it with cars built otherwise. If you can, take an engineer with you, and we will abide by his verdict.

$1150 Mitchell Junior

Note that this year's line includes two sizes—the Mitchell and the Mitchell Junior. But the Mitchell Junior—for five passengers—is still powerful and roomy.

This is also for efficiency. So the man who wants a 5-passenger car need not pay for more power or more room than he needs.

California Cultivator

Vol. XLVIII No. 10 LOS ANGELES: March 10, 1917 One Dollar Yearly

More Heat---Less Smoke

Conference of Citrus Growers at Pomona. Improved Orchard Heaters Demanded. Exhibit of New Types of Burners Which Give Almost Perfect Combustion

RESOLVED, That it is the sense of this meeting that black smoke (which is unconsumed carbon) is not desirable in orchard heating.

That we commend the efforts now being made toward the practical elimination of the smoke by securing a better burner, or improved appliances, looking toward that end.

That we solicit the cooperation of all citrus growers in forwarding the above work to the end that eventually, as the present heater equipment deteriorates, it may be replaced with the improved burners of a practical, economical and durable type.

* * *

THERE has been a great sum of money invested in equipping citrus orchards for fighting frost. Some think this puts too great a burden on the industry and that perhaps more is gained by taking chances than by equipping, but notwithstanding the immense losses of 1913 and the comparatively slight losses of this year we think the investment in frost fighting equipment installed in some orchards has been more than returned. We must also take into account the loss which comes from injury to orchard and fruits, also to household goods and stocks of merchandise because of the smoke nuisance.

One of the Latest Types of Orchard Heaters

This photo was taken by the Cultivator at the Pomona demonstration last week. As may be seen by the flame in the openings near the bottom of the pipe the stove was going at full draft when the photo was taken and yet there is no perceptible smoke escaping from the top of the pipe.

Amongst the Frost Fighters

At the reader's left is Fred J. Smith, Pomona pioneer and one of the first frost fighters, talking to D. C. Crookshank, chairman of the frost fighting conference and owner of a large orange producing property.

When frost fighting with oil first began the crudest of appliances released great clouds of smoke or, worse, clouds of soot which carried a certain amount of oil. This soot went through the tiniest crevices in to every home, and the injury was serious. The invention of burners giving more perfect combustion has lessened this nuisance. Merchants and homemakers in citrus sections insist that this smoke nuisance must be further reduced, and the orchardist likewise is insistent on this point, and to aid

Benefits of the Farm Loan Act

How It Will Help the Farmer. Some Details of Its Workings.

BY reason of the facilities created by the federal farm loan act, which was passed last summer, it will be easier in the future for a farmer to secure money to make needed improvements, or for the purchase of live stock, and it will be easier also for the landless man to purchase a farm, according to a recent publication of the department of agriculture (Farmers' Bulletin 792) entitled "How the Federal Farm Loan Act Benefits the Farmer."

The federal land banks established under this act will stand ready at all times, it is expected, to lend money to farmers on farm-mortgage security. The interest charges will be not more than six per cent, nor more than one per cent above the rate paid on the bonds sold by the banks. If four and a half per cent bonds should be issued, therefore, the rate charged on loans would be five and a half per cent or less. There will be no commissions or bonuses. The loans will be made for periods of time ranging from five to 40 years, thus doing away with the trouble and expense of frequent renewals.

The payment of a certain part of the principal annually or semi-annually, with the interest, will be required. The total payment, including the interest, will be the same for each year and will be just large enough so that the entire principal will be paid off at the end of the period. The annual payment thus required to pay off a loan of $1000, with interest at five per cent, in 20 years, is $80.24.

After a loan has run five years the borrower will be permitted to pay off the whole amount, if he desires, on any interest date, or to make partial payments in addition to the regular installment.

The requirement of installment payments on the amortization plan will serve first to cultivate habits of thrift in the borrower and second to make possible the placing of the loans at a lower rate of interest since the gradual reduction of the principal constantly improves the security for the unpaid balance. The privilege of optional payments after the first five years leaves the borrower free to discharge his indebtedness before the end of the loan period if he finds it convenient to do so.

The federal land banks will perform three important services. They will convert the security which farm mortgages afford into a negotiable form known as farm-loan bonds. They will furnish additional security for the protection of these bonds through their capital and surplus, and thus make the bonds more attractive to investors. They will sell the land-bank bonds in the open investment market, which for obvious reasons the small farmer could not reach to advantage.

The bonds are to be issued in denominations ranging from $25 to $1000, and it is expected that the bonds of small denomination will encourage saving through their appeal to individuals who have not been in the habit of making investments. The bonds will be secured not only by farm mortgages deposited in trust with a government official (the registrar for the land-bank district) but also by the capital and surplus of the 12 land banks.

Both mortgages and bonds will be exempt from all forms of taxation.

Farmers who wish to obtain money from the federal land banks will ordinarily be obliged to form local loan associations and to get their loans through these organizations. The local loan associations will improve the credit of their members and reduce the cost of their loans through the performance of certain definite services, among which are the following: The committee called the "loan committee" of the association will appraise the property offered as security and approve all applications for loans which are sent to the land bank. The secretary-treasurer of the association will transmit the papers and carry on all correspondence with the land bank relative to the loans. The association will guarantee the mortgages of its members, the liability of any individual member being limited, however, to an additional sum equal to the amount of his capital stock, or approximately to five per cent of his own loan.

One important function of the new system will be to establish safe standards for the farm mortgage business of the United States; for it is not proposed to extend any credit except on the basis of proper security. In addition to the indorsement of the local association, every loan must have the approval of one of the salaried appraisers appointed by the government for the several land banks.

Further, not more than $10,000 may be loaned to one borrower, nor more than 50 per cent of the value of the land offered as security plus 20 per cent of the value of the buildings; and the money must be used for specified productive purposes, such as the purchase of farm land, improvements, equipment, fertilizers, or live stock, or for the payment of existing indebtedness.

The federal farm loan board of the treasury department has general charge of the system. The department of agriculture will cooperate with this board in supplying information and rendering assistance to farmers who desire to take advantage of the federal farm loan act, especially with reference to the organization of local loan associations.

Frost Protection in Citrus Groves

By Prof. R. S. Vaile

Continued from Last Week.

Does It Pay to Smudge?

The question of whether such expense is justified depends on three things.

1. Liability of injury without protection.

2. Average length of time equipment would need to be used.

3. Average yield of the orchard to be protected.

The first question must be answered for each locality individually. Temperatures vary several degrees within very short distances so that government records for a given city may not have very much relation to conditions in groves surrounding that city. Except in extreme cases and unfavorable locations a one year injury is all that is to be expected. Table IV gives the shipments of citrus by counties as affected by the 1913 freeze. These figures indicate little effect holding over more than the one season. Of course individual groves felt a decided hold-over effect, but shipments as a whole were not materially influenced.

TABLE IV

Carload shipments by counties:

	1910-11	'11-'12	'12-'13	'13-'14	'14-'15	'15-'16
Los Angeles	14,723	12,695	5,025	16,536	14,066	14,793
Orange	4,069	3,529	3,762	4,806	5,578	6,165
Riverside	7,676	4,485	1,751	6,103	5,493	4,748
San Bernardino	12,031	10.506	2,877	12,857	12,045	9,824

The average annual liability must be greater than the fixed charge of $26.00 per acre. If oranges are worth $1.00 per field box the average annual loss must be 26 boxes per acre, or 130 boxes every five years. There are certain districts where the risk is much less than this and one immediately concludes that protection is not justified. Table V gives the annual risk in field boxes at $1.00 each, that should be present to justify various expenditures above the $26.00 fixed cost.

TABLE V

Annual risk necessary to justify smudging. Figured in field boxes at $1 each:

Fixed cost.	Operating cost.	Total cost.	Field boxes.
$26.00	$ 5.00	$31.00	31
26.00	10.00	36.00	36
26.00	20.00	46.00	46
26.00	30.00	56.00	56
26.00	40.00	66.00	66

(See table III.)

In other words, if experience shows that 230 field boxes are lost by frost damage on an average of once in every five years, one would be justified in maintaining a complete equipment. and if it were not used at any time except on that one year he would be justified in spending $100 for operating costs during that year. Refering again to Table III, that $100 would permit 20 hours of light firing, 20 hours of moderate firing, and five hours extreme firing. Or if, on the other hand, the cold weather came once every three years with no firing on the intervening years, and if experience shows that as much as 138 field boxes per acre might be lost every third year without protection, then one would be justified in fully equipping the grove and spending an average of $20 an acre per year for operating expenses, or $60 per year for the one year in three. Referring again to Table III, this $60 an acre would permit of 20 hours of light firing, ten hours of moderate firing and five hours of extreme firing. If, on the other hand, one is in a district where some damage is realized every year, if that damage amounts to as much as 46 field boxes per acre per year one is justified in fully equipping and in spending $20 per acre every year for operating expenses. Again referring to Table III, this $20 would permit of 20 hours of light firing or ten hours of light firing and five hours of moderate firing each year. It will be remembered that if the four typical cases which were reviewed earlier in the discussion of this season's operations, none of them showed as much firing even as would be allowed as an annual proposition in case the risk is as much as 46 field boxes each year.

Continued Next Week.

Balanced Ration for the Orchard

From Address by C. I. Lewis, Chief Division of Horticulture, Oregon Agricultural College, at Corvallis

A SOIL is really known by the crop it will produce. Provided climatic conditions are favorable a properly balanced soil should produce first class fruit. Unfortunately much of our soil does not produce such fruit. Trees need certain balanced foods. If one of these necessary foods is missing the tree is upset and its functions are interfered with. It is like the old adage—"A chain is no stronger than its weakest link." In the same way our soil is no stronger than its weakest necessary element.

The animal husbandry men know that an improper diet reacts on the animal: too much coarse material makes too large a barrel: too much concentrated food means an upse diggestion. The skillful animal hus bandry man studies his animals ver carefully to find signs of impropе feeding. Our fruit trees hang ou just as strong signs. They are con stantly furnishing us with a barome er which we can read.

Definite chemicals enter into th make-up of an apple tree and it fruit. These can be divided naturall into two classes. First, those whic are very essential and are often d ficient and, second, those which ar generally not quite as essential an are generally present in the soil.

The first class embraces nitroge potash, phosphoric acid and lime. Th second class includes such solution as iron, sulphur, sodium, etc.

The Only Car

That Does Those Things Is

Hudson Super-Six

The Super-Six is the only car that ever went 1819 miles in 24 hours.

It is the only car that ever went from San Francisco to New York and back in 10 days and 21 hours. In that one round trip it twice broke the ocean-to-ocean record.

At Pike's Peak, a Super-Six Special defeated 20 great rivals, all specially built for hill climbing. It made the best time in the world's greatest hill-climb.

It holds all the speed records for stock touring cars, and the records for quick acceleration.

Note What That Means

You say you don't want a racing car. We know you don't. You will never, perhaps, use half the power or speed of the Super-Six.

But mark that this motor is a small, light, simple Six. We have added no size or cylinders. We have taken a light Six and, by this invention, increased its efficiency 80 per cent. And solely by reducing friction, which destroys the motor and wastes its power.

We Did Just This

The Six-type motor had great limitations. Despite all perfections, much vibration still remained. And vibration causes friction.

Some engineers, including the Hudson, were testing Eights and Twelves. They felt that twin-type motors might solve the friction problem. The trend was away from Sixes.

Then Hudson engineers brought out this Super-Six invention. It is a Hudson invention, patented by Hudson. In this new-type Six they obtained all the efficiency and endurance sought for in the multi-cylinder type and they did this without adding cylinders, complications or weight.

All in Endurance

All the Super-Six records—for speed, hill-climbing and long-distance—were won by this motor's endurance. They mean that motor wear and friction are reduced to almost nothing.

By excelling in these feats, it proved that this motor will outlast any other type.

That is what you want above everything else. You want less wasted power, less wear, less friction. That means, of course, supreme performance. But it also means supreme economy.

What You Can't Afford

Some men will say, "I can't afford a superb car like the Hudson."

But you can. All this beauty, luxury and superlative performance will cost you less than many a car without them.

The Super-Six invention, in all probability, doubles the life of a motor. It saves the power which was wasted in friction. And this year we add a new gasoline saver which saves a great deal more.

No other fine car gives such value as the Hudson. No other car has a motor which compares with this. A higher-quality car is impossible. Yet note how far the Hudson undersells many cars that it out-performs.

Go see and prove this car. It is now the largest-selling car above $1200. And the saving shows in the Hudson price.

The R. M. TEAGUE CITRUS NURSERIES

Successors to

The San Dimas Citrus Nurseries

Teague Trees are Quality Productive Trees

Because properly grown and budded from selected trees producing abundantly only quality fruit. Buds cut from carefully selected fruiting bud-wood only. In addition we give quality service in the way of digging, packing and delivery that insures success to the planter. Correspondence and inspection invited; our treatise on "Citrus Culture" and annual Price List sent on application.

R. M. TEAGUE, Manager

San Dimas, California

Nitrogen is the life giving element. It gives vegetative growth, makes vigorous wood and foliage, and determines to a large extent the percentage of crop. When used to excess it produces abnormal wo-- growth and overgrown specimens of fruit.

Potash is the basis of fruit acids as well as a large percentage of the ash, and when properly balanced has much to do with maturity and good firm growth of the tree. Potash is sometimes said to be the principal element in producing color. This, however has not been thoroughly demonstrated. The proper balance of nitrogen probably has more to do with the degree of color than any other factors as far as food is concerned.

Phosphoric acid aids in maturity and is stored in large quantities in the seed.

Lime is an important factor in making plant food available. It has a mechanical, chemical, and biological influence and probably, indirectly at least, plays a role in cell structure.

To determine the weak links in your soil and to determine whether your trees will be improved by the aid of a certain plant food, it is essential that you divide a small portion of your orchard into plots where you can try out these various elements. On a dozen trees which are situated in a block apply nitrate of soda at the rate of 100 pounds per acre. To another block apply high grade potash, such as muriate or sulphate, at the rate of 100 to 150 pounds per acre. On a third block apply a high grade superphosphate, 100 pounds to the acre.

Then on the one plot use all three: then use combinations of two and finally a plot for lime. This will give you eight plots which will not cost very much money. Apply the fertilizer about a month before the trees bloom and if possible harrow it in.

From my own personal observations and experiments, as well as data I have obtained from chemists and other scientists, the great element that is apt to be lacking in the light soils of the Pacific Northwest is nitrogen. Its lack is shown in low vitality of trees from 12 to 25 years of age, thin, small, yellow foliage and weak wood growth, feeble blossoming and small percentage of set, small individual specimens of fruit, light crops and an increase in functional troubles, such as little leaf, apple rosette, so-called winter kill, dry core rot, and so on.

During the past three or four years we have been conducting extensive experiments in Oregon. Nitrogen has been added to the orchards in dry form, in the form of a liquid on the ground, or as a spray on the trees.

With the exception of the first year nothing was seemingly gained by placing a liquid on the ground or spraying it upon the trees. The average of the three years is slightly in favor of these practices, owing to the fact that the first year they gave more striking results than did the dry, because the season was so dry that the crystals did not get into solution. Had we added the dry crystals a month before the blossoming time we would have secured more striking results. The check orchards have been improving during the three years, but the planting of clover and alfalfa and also irrigation have had an influence and the fact that the trees have rested for several years makes some difference.

Striking results have been secured in the Hood River Valley with apples and peaches on light soils in the Rogue River Valley. The increase in yields by the use of nitrate of soda is about seven to one, but one of the most striking characteristics seems to be that there was less frost damage among the trees which received the nitrogen. Our theory is that the stimulation strenghtened the buds and spurs and made the trees more vigorous, for during the entire season there has been a wonderful improvement in the vigorous, healthy, green appearence of the trees, while where other fertilizers were used or where none was used, the trees had a starved appearance. Also with peaches, while we did not receive remarkable results the spring the fertilizer was applied, we secured very striking results the second year, due we feel to two conditions. First, the nitrogen made the trees vigorous and healthy and furnished strong buds. Second, these trees seemed to be more frost resistant. The results are that this year, for every 36 boxes of peaches from the nitrogen plots, we have only secured at the rate of 7-9 from those plots where other fertilizers, or no fertilizer, has been used. A large commercial orchard at Hood River this year gave 23,000 boxes, last year, 1,500 boxes and the year before 4,500 boxes, the increase coming from the use of nitrate of soda at the rate of five to six pounds to the tree.

This nitrogen fertilization is relatively inexpensive. From five to seven pounds of nitrogen to the tree is ample, and this will mean a cost of only 16 to 20 cents per tree. Our work is demonstrating that this fertilizer to be of the greatest value should be added to the soil a month before the trees bloom. In fact our work is pointing strongly to the fact that moisture and food added just before the trees bloom plays a mighty role in the corn which will be picked the following October. It was formerly thought that the nitrate would have only a very brief effect on the trees, but our results indicate that trees stimulated in this way may continue vigorous for at least three years and possibly longer. We believe that in orchards where nitrogen deficiency is demonstrated that the orchard should be sown to shade crops and irrigated if possible. Where this cannot be done possibly the growing of cover crops will suffice to supply the organic matter and nitrogen, giving you the desired physical, chemical and bacterial condition in your soil.

We feel, however, that the nitrogen question can be easily overdone and we fear that some of the orchards are going to be overstimulated.

In conclusion I will state that we feel from our work at the Oregon Experiment station that the missing element in most of our light soils is nitrogen and that the trees can be aided to a remarkable extent through the use of nitrate of soda applied three to seven pounds to the tree, and that the trees must be well supplied with food and moisture in the early spring previous to blooming and that this knowledge may result in important revolutions in our orchard practices in the Northwest.

Nitrogen seems to affect the set of fruit at the time of blooming and later the size of crop, size of individual specimens, color of fruit and general vigor of trees. And lastly, it is very easy to overdo the nitrogen stimulation and, consequently, orchardists should keep in close touch with the horticulturists in the various experiment stations concerning the use of this valuable element.

The Golden Gate Weed Cutter

cuts seven feet or less, weighs 230 pounds and is all made of steel. The Golden Gate Weed Cutter is the greatest of its kind on the market. For workmanship, simplicity and durability it cannot be excelled as it does its work to perfection. Those who are using it say that no money could buy it if they could not get another. It not only cuts all kinds of weeds, but cultivates the ground as well. One user said that it has saved him $200.00, as he did not have to plow after using.

MORE HEAT—LESS SMOKE

Continued from Page 275

in this campaign for better and more economical combustion of the oil a meeting was held in Pomona last Friday, when frost fighting from its various angles, was discussed. Several burners with practically no smoke emitted when in full operation were exhibited. Some of these—of which there were about 15 different types—are almost perfect. A white card held over the smokestack, which seems to be a feature of most of the improved types, showed absolutely no soot or mark of smoke.

The question now is whether these burners may be invented, manufactured and sold to the growers on an economical basis. As indicated above, many growers believe in taking chances rather than in making an investment of from $100 to $200 per acre required for present-day appliances. Formerly it was thought that a higher grade oil with a lower percentage of asphaltum, or with practically none, would result in cleaner burning, but it has now been shown that the cheaper oils in the proper kind of burner give out a greater number of heat units than the higher grade oils with an indifferent burner. Presumably then, it is a question for the burner maker rather than for the oil manufacturer. This is fortunate, for it would be an impossibility for the manufacturer of the oil to provide on but a few moments' notice the trainloads of oil which are necessary when the emergency comes.

The Pomona meeting was presided over by D. C. Crookshank, and C. N. Burton acted as secretary. The meeting had been called by the Pomona chamber of commerce, of which Mr. Crookshank is the president. It was more in the nature of a conference, for there was no previously arranged program, but Mr. Burton requested that in the discussion the three factors noted in the resolutions above should be considered as far as possible.

Joining in the conference, besides Pomona people who have put up the most effective campaign of any one section of the state, there were Messrs. Fleet of the Sespe Ranch, Willis Jones of the Claremont section, Huff of Orange County, Price, Laidlaw and Hamilton of Ontario and Uplands, Prof. Vaile of the experiment station, with Adamson, Smith, Nichols and others of the Pomona section. After the discussion and adoption of the resolutions at the head of article the meeting adjourned to examine into the merits of the various heaters exhibited.

• • •

NOTES

Eliminate the smoke. More heat, less "smudging."

The amount of asphaltum in the oil or the quality of the oil is of less importance than the efficiency of the burner.

Electricity has been tried in the heating of orchards. As yet it is not a success, but with improved heaters and in view of the fact that the electric current would be used in orchard heating at a time when not needed for transportation and other activities, orchard heating appliances operated by electricity call for more investigation.

Injury to citrus fruits is caused by humidity, or lack of it, to a greater extent that by change in temperature.

Frost in July is a long question and one which many an orchardist fails to grasp. When the scientists begin discussion of dew point, dry and wet bulb, temperature, radiation and some others of the factors which enter into the control of frost injury we all get muddled.

It is important to get temperature of the fruit. This is done, excepting in the case of smallest sized lemons, by the use of the pencil type of thermometers inserted in opening made in the fruit.

The air temperature is often low enough to indicate possibility of injury while the fruit temperatures may be higher. Here is where "radiation" and "low dew point" enter into the discussion.

"We cannot expect to eliminate entirely all smoke from our orchard heating operations. Our modern railways are examples of efficiency and waste reduced to the minimum, but note that a locomotive under forced draft emits vast quantities of dense black smoke. It is only reasonable then to suppose that our heaters cannot be made more efficient than the ordinary locomotive."

"Soot is not smoke. Soot is unconsumed carbon. It may in a large part be eliminated by combustion."

"There has been vast improvement in heaters during the past four years. Let us work together for still greater improvement and not work against each other by objecting."

The chemical combination of the hydrogen of oil with oxygen of the air makes water. Water in the air makes lower dew point, lower dew point makes for less injury to the fruit, and besides this, moisture in the air acts as a blanket over the orchard to prevent general radiation of the heat.

There are streaks of cold and streaks of warmer air. If they can be mixed the orchard is saved. It has usually been the custom to fire "across these streaks." "We now believe it is better to fire with the streaks."

HOME GARDENS

The Los Angeles Chamber of Commerce announces a series of lectures on home gardening. The talks are only 15 minutes long at 12 o'clock daily beginning Monday, March 12. At that time Hon. Eugene Grubb of the Southern Pacific Company will talk on potatoes and how to grow. Other lectures daily will follow in this order: "Intensive Gardening," C. F. Palmer of Los Angeles schools; "A Little Land, a Better Living," C. L. Schufeldt; "Successive Cropping," Commissioner Wood; "Garden Seeds and Relation to Garden Soil," H. L. Musser.

NITRATE OF SODA AND THE USE OF COMMERCIAL FERTILIZERS

By Ricardo Simon

IN the March number of the California Citrograph, J. F. Breazeale of the United States department of agriculture, Riverside, has contributed an article entitled "The Use of Commercial Fertilizers." In the last paragraph he says: "With the experiments which are now going, in a few years we will know the best methods of cultivation and irrigation and what fertilizers will produce the best results. But just now we have many men of many minds, and are in the "transition stage between guesswork and hard facts."

Not one of the many citrus growers but will agree with these last remarks of Mr. Breazeale. On the face of it, this reads like an unbiased and unprejudiced statement of facts.

But when we turn to the first half of his article we are astonished to find that Mr. Breazeale has reserved to himself the unique position of being the only one who has passed the transition stage between guesswork and hard facts". Let us read what he here says: "If I were fortunate enough to own a citrus grove, with my present knowledge of fertilizer requirements, I would certainly use some commercial fertilizers. I would probably under certain conditions even use some nitrate of soda which in my opinion is probably the least desirable form of fertilizer upon the market."

This uncalled for attack on nitrate of soda seems almost incomprehensible. Is it based on scientific or commercial data? With one dash of his pen Mr. Breazeale sweeps aside the work of the foremost agricultural and scientific specialists of the world, of Dr. Paul Wagner and Professor Maercker of Germany; of Lawes and Gilbert, Sir William Crooks, Dr. Dyer, Dr. Hall and Dr. Voelcker of England; of Professors Grandeau, Cassarini, Migneaux and Cadoret of France; of Professors Bernardo and Alino of Spain; of Drs. Edward B. Voorhees, Brooks, Duggar, Ross, Patterson, Hilgard and Garcia of America.

But let me quote a few lines from a pamphlet on "The Cost of Available Nitrogen", by the late Dr. Voorhees of the New Jersey agricultural experiment station, and see what he has to say about nitrate of soda and its value:

"In 1898, plant nutrition experiments were begun at the New Jersey station, one object of which was to study the 'relative availability' of these three forms of nitrogen, (ie. nitrate, ammonia and organic nitrogen), using a rotation of corn, oats, wheat and timothy,—crops which, because of their long periods of growth would be likely to absorb relatively large proportions of organic nitrogen. The results of these experiments for two rotations (ten years) show that the recovery for nitrogen as nitrate was 62.09 parts per hundred; for the nitrogen as ammonia 43.26 parts per hundred, and for organic (dried blood nitrogen), 40 parts per hundred. These results agree almost exactly with those obtained by Dr. Wagner and his associates. With the returns from nitrate, the highest recovery regarded as 100, the relative availability of the nitrogen as ammonia would be 69.7 and of nitrogen as dried blood 64.4.

"A concrete example will make clearer the economic phases of the question. The analysis of the various brands sold in the state of New Jersey in 1909 shows an average of 2.5 per cent of total nitrogen, divided as follows:

Nitrate ..... .48% or 19% of the total
Ammonia ..... .77% or 30% of the total
Organic ..... 1.32% or 51% of the total

"Assuming that the forms of organic nitrogen used in these brands were as good as in dried blood, it would require 1.55 pounds of the organic nitrogen to furnish as much 'available' nitrogen as is contained in one pound of the nitrate nitrogen, and 1.43 pounds of the ammonia nitrogen to furnish as much 'available' nitrogen as is contained in one pound of the nitrate nitrogen. Yet because of commercial conditions the farmer paid a higher price per pound for his organic nitrogen than he paid for his nitrate and his ammonia nitrogen. Using the same relations that exist in the commercial cost of nitrogen, the actual prices paid were for organic nitrogen 26.52 cents per pound, ammonia nitrogen 23.73 cents and nitrate nitrogen 23 cents. At these prices the nitrogen purchased in New Jersey last year cost about $1,157,400 and in the entire country nearly 60 times as much. If, therefore, instead of buying organic and ammonia nitrogen, nitrate only had been purchased, the same gain in crop from the use of the nitrogen could have been purchased for $733,460 instead of $1,157,500."

The above data, given by the late Dr. Voorhees' work, but corroborated much of that already done by Dr. Paul Wagner.

It might be well for Mr. Breazeale to bear in mind the words of Dr. Voorhees, to-wit: "The experiment stations do not discourage, but strongly encourage, the utilization of waste products containing nitrogen. They would be false to their duty to the farmers, however, if they did not clearly point out to them what is known of the relative agricultural value of such products . . ."

Farm Adviser Williams of Sacramento County announces farm bureau meetings at Wilton March 10, Fair Oaks 14, Elk Grove 17, Franklin 21, Hood 28.

Plant ROEDING'S Persimmons

The commercial importance of the Japanese Persimmon is well established, and as a result of experimenting, a number of very fine varieties are worthy of extensive cultivation.

The Persimmon is a delicious fruit, and no garden is complete without it. Those who have the foresight to plant an acreage now, will, undoubtedly, be well repaid later. We have a good stock of the best grafted varieties, and will be pleased to quote prices on request.

Citrus Trees

Roeding's Citrus Trees have made a great record for themselves among thousands of planters throughout the state. We use the greatest care in the selection of buds from trees showing the best type and continuous bearing habits.

We grow in our nurseries, under the most favorable conditions, all the best varieties of Oranges, Lemons, Pomelos and Avocados.

Caliper sizes and prices on request

Olive Trees

PLANT AN OLIVE ORCHARD

The acreage devoted to Olive culture in California needs to be greatly increased. The Manzanillo is becoming more and more a favorite with packers—ripens early, very hardy, a regular and prolific bearer.

The Mission is an old favorite—tree a handsome, upright grower—fine for avenues.

Both the Manzanillo and the Mission are good for either pickles or oil.

Walnuts

All walnut grafts used by us are cut from trees of the very best types, which Mr. Roeding has carefully preserved and recorded for a period of years.

Landscape Gardening

Ornament your home grounds with Roeding's evergreen trees, shrubs, palms, vines and roses. Suggestions regarding laying out grounds furnished free by our Landscape Service Department.

Write for New Illustrated Catalog

If you have not already sent in your name for a copy of our 1917 illustrated price catalog, do so today. It lists and prices over 2000 varieties—and will be sent free upon request. When writing send us your list for suggestions and advice as to varieties.

President & Manager

236 Holland Bldg.
Fresno, Cal.

What are Pedigreed Trees? We want You to Reason Before You Buy Citrus Trees.

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries,—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertilizer, labor, investment tied up in land—these are the big factors that go to pot if, years after the trees are planted, the grove bears miscellaneous offspring.

Europe's many tongues and consequent misunderstandings

The Fruits of Understanding

Throughout the vast area of this country prevails a common tongue. The whole of Europe hardly exceeds our territory, yet Europe has more than a score of nationalities and many different languages.

In the United States the telephone, as exemplified by Bell System, renders a matchless service in its mastery of distance and in encouraging the use of a universal language. This accomplishment is in spite of the great influx of population from every country in the world.

In Europe the independent countries, separated by barriers of language, and lacking efficient telephone service, suffer from inadequate facilities for inter-communication.

We now talk from the Atlantic Coast to the Pacific, and eliminate more than three thousand miles. In Europe, contending with a babel of voices and unrelated telephone systems, a bare quarter of that distance has been bridged with difficulty.

The ideal of the Bell System has been day by day to extend its service in the interest of all telephone users. Its efforts have resulted in providing the facilities to unite cities and rural districts in true American democracy.

Natural Gardening

Written for California Cultivator By E. Braunton

NATURAL or landscape gardening consists in making beautiful pictures rather than a collection of plants and objects, no matter how interesting or beautiful these objects may be in themselves. The true test of a garden is, will the artist care to paint it or photograph it? If it strongly attracts him you have succeeded admirably.

Mere grading, introduction of road, paths, etc., and planting, no matter how finished, do not make a landscape; on the contrary such work often spoils one which naturally constituted a beautiful picture to those who know. Plants have of themselves but little value unless properly placed. Scattered about promiscuously, without aim or association, they may be fine plants but they do not make a landscape garden. Properly massed they present attractive groups and perfect pictures of natural beauty.

School Grounds

In these more modern days it is considered desirable to have school gardens rather than mere school grounds. These considerations should lend themselves to decoration of school yards, in which the school garden should play an important part. Aside from the reservation of space for tilling the soil the greatest need of schools is shade and protection. If violent winds prevail the side toward the wind, or two sides, should be planted with Monterey cypresses fairly close together. If shade for summer alone is desired plant trees that will grow large, cast abundant shade and shed their leaves in autumn so that the area may be warm and sunny during winter. For this purpose none is of greater value than Platanus orientalis, the oriental plane or sycamore.

Rural Parks

When are we to have rural parks belonging to community or county? It is coming to be recognized that rural residents need parks for rest and recreation fully as much as do dwellers in the city. In some Eastern states may be found parks owned and controlled by the townships, where the latter contain no town, or village, or even a post office. Some such plan is possible in California, or counties may purchase spots of great natural beauty and interest and hold and improve them for the benefit of all the people. We are all coming to feel, however, that every community should have a park or reservation reasonably available to the most thickly settled portions of the district.

Bizarre Gardening

It must not be thought that in olden times all gardening was more or less barbaric, for in every stage of the world's history we find traces of nature lovers. Landscape gardening, or the natural way, first found expression in England a little more than a century ago. But more than 300 years ago Bacon wrote: "As for the making of Knots or Figures, with divers Colored Earths, they be but toys, you may see as good sights many times in Tarts. I do not like Images cut out of Juniper, or other garden-stuff; they are for Children."

Layer Propagation

Too little attention is paid by those of limited time and means and likewise limited needs, to propagation by laying. Take lower branches of carnations, shrubs of many kinds, also vines, and lay them upon the soil, dig out a hollow, cut stem of plant halfway through, put cut part in hollow, cover with soil, peg down with hairpin or a double piece of wire and leave until well rooted. Then cut away and plant. Tops on tall, "leggy" plants, or side branches may be layered in same manner of preparation, but binding the parts up in balls of florist's moss instead of soil. The balls of moss must not, however, be allowed to dry. Keep dampened until roots show through. Then cut away young or new plants.

Perennial Peas

Many find the yearly planting of sweet peas too much care, and too much care must be lavished upon them or results are poor. While this is true there is no other means by which you obtain the wondrously beautiful modern sweet pea. But if you will be content with two or three colors, and these not very good, and with small crops and short stems; in short if you merely wish pea vines to cover a fence, wall or other object, seed stores will furnish you with seeds that will give you plants admirably suited to the purpose.

Tree Asters

In New Zealand there are about 100 species of olearias or tree asters that have found wide acceptance in some counties but not in the United States. They did, however, create quite a sensation at the New Zealand exhibit at San Francisco in 1915, where they flowered abundantly. It is rumored that at least one San Francisco firm has these plants for sale. None are known to be in Southern California though we are assured they would thrive.

Raising Tomatoes at 5300 Feet

Written for California Cultivator By W. F. Hewlett

OUR location is the top of Palomar Mountain, San Diego County, 70 miles north of San Diego City, and 5300 feet above sea level.

When we purchased this place the former owner told us that we would not be able to raise tomatoes because of early and late frosts. As we were very fond of them we resolved to do our best to overcome the climate, and for three years have succeeded in producing the ripened fruit. Especially was this so the past season, owing to our having studied the climatic conditions and in a great measure overcome them.

We began preparations for planting seed March 15 by sawing oil cases in two, making two shallow flats out of each box. Then the tops and bottoms were melted from large size condensed milk cans, leaving cylinders of tin. These were placed one end down in the flats and filled with rich loam soil taken from under trees in the timber, and seed planted in them. The boxes were carried into the house and kept in one corner of the dining room near a sunny window.

As the plants grew, they were transplanted to other cans of same

style, leaving only one plant to a can. They made a fine, strong growth, and whenever the weather permitted were placed outdoors to harden, preparatory to planting.

Early in May a piece of ground in yard surrounding house was plowed and six rows for 82 plants were staked off. The stakes were placed four feet apart in the row and the rows six feet apart.

Holes were dug with a trowel, about one foot deep and eight inches across. In the bottom of each hole was placed two trowelfuls of mixed chicken manure and ashes, which was well dug into bottom of hole. Water was then poured in holes, half filling them.

The plants were removed from the cans by inserting a small wooden potato masher into bottom of can and pushing out ball of dirt. We were careful not to break soil about plants and they were set in water in hole and dirt filled in and well pressed down. The plants were set very deep, so that when hole was finally filled the leaves of plant were level with ground.

Last of all, a small pan was made about each plant, filled with water, allowed to soak away, and dirt filled in.

Six varieties were set out, viz: First Early, Earliana, Stone, Ferris Wheel, Little Giant, and Mack.

May 19 the weather turned cooler, and in anticipation of frost we made cones of heavy wrapping paper large enough to cover each plant and with a projecting edge upon which to place dirt to hold them down.

We watched the thermometer closely, and whenever it started down placed the cones over plants. We thus saved every plant through the cold spell while others about us who did not protect plants, lost them and had to make a fresh start.

Shortly after danger of frost was over six-foot stakes were cut and driven in near each plant, leaving about five feet of pole to tie plant to as it grew. Pans were then made about each plant, large enough to hold a pail of water. These were left open throughout the entire growing season and three times each week were filled with water from garden hose.

As the plants grew the lower branches were pruned off and tops tied to stakes. The fruit set well, and we were not troubled with blight.

We picked our first ripe tomato from the First Early July 27. The Earlianas soon followed and by August 17 we had an abundance. They ripened as follows: First Early, Earliana, Mack, Stone, Ferris Wheel, and Little Giant. Our largest tomato was from the Ferris Wheel and measured 15½ inches in circumference and weighed one and a half pounds.

We picked a total of 1075 pounds of tomatoes from the 82 vines up to October 3, when an unusually early frost caught and killed the vines. We estimated there were still about 500 pounds of green tomatoes on vines when killed by frost. This from a piece of ground which measured 1-22 of an acre.

From the crop we sold several hundred pounds, canned 125 quarts and had sliced tomatoes on the table nearly every meal during the season. The plants were a sight when at their best and greatly admired by all who saw them and fully repaid us for the extra effort spent in growing them.

The Rhizoctonia Disease of Tomatoes

The disease of tomatoes known as blight, yellows, yellow blight or western blight, is due to the sterile fungus, rhizoctonia, which lives upon the roots of the affected plants. According to the pathologist of the Washington experiment station, the symptoms and effects of the disease are as follows:

Dwarfing or reduction in size of plant; production of rosette type of growth; discoloration of foliage; curling of leaflets; reduction in size of fruit and premature ripening or failure to set any fruits; wilting and death of entire top.

Net work of brown fungous filaments upon the surface of the roots; occurrence of black nodules (sclerotia) at various points upon the roots; dead corroded areas (lesions upon the roots or base of stem; death of roots from tip backward; abnormal production of adventitious fibrous roots.

The parasite is present only on the roots or basal portion of the stem and the symptoms shown by the foliage are only an indirect effect of the parasite. The disease may be barely evident or sufficiently severe to kill the affected plants. The same fungus causes the "damping-off" of seedlings.

Control

The fungus is common in many soils and attacks many wild plants and cultivated crops. It has been noted during the past two years as the cause of serious disease in potatoes, beans, beets, peas, cucumbers, peppers and strawberries. Infected seed potatoes are undoubtedly responsible for many cases of serious soil infection.

Use soil free from rhizoctonia for the growth of tomato plants if they are to be transplanted, or if the soil is infected use some method of sterilization.

Avoid ground upon which potatoes have been grown during the past four or five years. Give attention to the possible occurrence of the disease upon some other crop that might have infected the soil. Cereals and other grasses are never attacked by rhizoctonia.

Supply growing plants with abundance of moisture. Lack of moisture increases the severity of the disease since the fungus is constantly cutting down the supply of absorbing roots, and so making it more difficult for the plant to obtain sufficient water. Good cultivation for the aeration of the soil is an important factor.

Use liberal amount of barnyard manure to stimulate the growth of the plants, and if the soil is known to be acid use lime also.

In transplanting do not set plants too shallow. Deep setting gives a greater opportunity for the development of adventitious fibrous roots to take the places of those killed by the fungus. It may even be advisable to set the plants in shallow trenches and gradually fill around them with successive cultivations.

Growing the plants in the field to avoid transplanting is sometimes of value, but carefully transplanted plants that suffer little or no check in their growth are more likely to keep ahead of the fungus.

In case soil infection is suspected, early fall plowing with frequent cultivation seems by aeration of the soil to lessen amount of fungus that will remain alive. Some growers have used this practice with excellent results.

Sudan Grass

Califlora Brand

This is one of the best known forage crops used in the Southern and Middle Western states. It grows from 5 to 10 feet high and will produce four crops of hay under irrigation and usually two crops without irrigation. It thrives in the valley and foothill sections of California. It yields more to the acre than any forage crop we know of, and the quality of the hay is excellent. The stock of this seed is short and we anticipate higher prices in the near future.

BUY NOW—Lb 50c; 10 lbs. $4.00; 100 lbs. $35.00

ALFALFA SEED---Califlora Brand

This is our best grade of common Chilian Alfalfa seed. On every test this brand of Alfalfa seed has surpassed all others. We do not believe its equal can be had elsewhere. When buying this grade you are not paying for any weeds or chaff. It is the cheapest to plant because it is the best. Send for price and sample. We also offer superior stocks of GRIMM, HAIRY and SMOOTH PERUVIAN and TURKESTAN Alfalfa Seed.

SEED POTATOES

Splendid stock of OREGON GROWN American Wonder, Early Rose and Garnet Chili Seed Potatoes. These are all good early varieties. Write for prices and quantities desired.

LIGHT DRAFT PLOWS

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

P&O

Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Traction Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P&O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P & O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Squirrel Poison

A subscriber from Yreka and one from Santa Susana both wish information as to a satisfactory squirrel poison. The Yreka subscriber is not only having trouble with squirrels injuring various crops but they are also taking eggs out of the nests.

The remedy most often recommended is that used by the hospital service of the federal government in its campaign against the rodents about the bay counties. This has been found satisfactory by farm advisers and others in all parts of the state. The formula is: Whole barley, 20 pounds; starch paste, one pint; strychnine sulphate, one ounce; saccharine, one dram. The barley is placed in a receptacle large enough to permit thorough stirring (as a wash tub). One pint of water is then brought to a boil and sufficient laundry starch (about two tablespoons dissolved in a little cold water) is slowly added to form, when well cooked, a paste about the consistency of cream. The strychnine, (first powdered if in crystals) and the saccharine, are now added to the hot starch paste and the mixture well stirred until dissolved. While still hot this is poured over the barley, mixed well, and the whole put aside for several hours before using. Scatter a teaspoon of the poisoned grain along the squirrel trails on hard places near the holes. The poison should not be placed in heaps on the soft mounds at the mouths of the holes. It will probably be found most efficient if scattered early in the morning between the hours of three and seven a. m. Poisoned grain should not be placed in wet weather. Its destructive properties will not deteriorate with age so long as the grain is kept dry and free from moisture.

Besides the above there are most excellent poisoned grains and other control methods which have been advertised in the Cultivator.

Another satisfactory method, and one which we would employ near poultry yards or farm buildings is the use of the squirrel destructor or some other agent for pumping poisonous gases into the holes. Then make a campaign, ridding the place of them through suffocation. This is done by the use of carbon bisulphide. Where there are but few holes to be treated fairly satisfactory results may be had by saturating cotton waste, or even old rags, with gasoline, putting these down and filling at once. The fumes of the gasoline do the rest.

Minorcas as Layers

What do you think of the Minorcas as layers; are they as good as the White Leghorns? Are their eggs good sellers or are they too large? Could you tell me where I could get White Muscovy duck eggs for hatching?—Subscriber, Porterville.

Minorcas are all right. Their friends claim that they lay as many eggs as Leghorns and they certainly lay larger eggs than the average Leghorn. "The eggs sell themselves", says a Minorca breeder, because of their size. Probably there are poor strains of Minorcas as well as of other breeds, but they have an excellent reputation and are considered better table birds than Leghorns in spite of their black feathers. You will find advertisers of White Muscovys in the columns of the Cultivator.—J. A. K.

Lime on Adobe

Please advise if an application of lime to a stiff, adobe soil would make it more friable and easier to work up fine? If so, what form of lime and what quantity per square rod would be advisable, and at what season should it be applied?—Subscriber, Porterville.

Yes, apply say ten or 12 pounds per square rod of air-slaked or, for a small area, hydrated lime might be applied. Would apply at once and in addition the lands may be greatly benefited by heavy applications of coarse manure. This aids in admitting air and loosening up the soil.

Is Sudan Satisfactory?

We will be glad if live stock people who have had experience with feeding Sudan grass will answer the request of Mr. A. L. Grigsby of San Diego County. He writes:

"Would like to ask if Sudan grass hay will cause a dry cough in horses? My horses all have a dry cough which started after I commenced feeding Sudan hay. There is no discharge from the nose to indicate distemper. From my experience and in talking with others I learn that those who handle the hay are troubled with a dry cough. The hay is perfectly cured and the stock seems to relish it. Would like to hear from subscribers regarding this point."

Turkeys with Water Bags

Could you give me a remedy for my turkeys? They have large water bags under the eyes. They can be pressed out but fill up again. Turkeys have good appetite but do not gain in weight.—Subscriber, Woodland.

Is this a sort of air puff, such as is sometimes found on the neck or shoulder of a half grown chick that has been injured? Or is there, perhaps, something roupy about it? If the turkeys are males, and old enough to fight, it may be these bags are produced by the injuries suffered in fighting. In this case removal of the cause is the only remedy. If there is roup, either incipient or half developed, there should be some running of the eyes and a little stickiness about the discharge. If the turkeys are young and do not gain in weight something is wrong either with the ration or with the turkey itself. Young turkeys should not be fat, but there should be some slight gain from week to week. For any symptom of roup there is nothing better than the potassium permanganate treatment.

Put in a quart pail of warmish water enough permanganate crystals to color the water a deep pink. Immerse the turkey's head in this while you count ten, and repeat twice daily till there is improvement, preparing the permanganate fresh every time. See that the turkeys have absolutely fresh air at night, but are protected by some sort of shed from the rain, and that they get oyster shell and some animal food, preferably clabbered milk. If they are not on green range they should have an absolutely unlimited supply of green feed. It is often wise to feed chopped onions and onion tops and lettuce, even when the birds are on range, for they do not always get the right sort of green and are sometimes lazy about helping themselves.—J. A. K.

Scours

Am feeding very rich garbage to pigs, mixed with small amount of bran. Have some trouble with scours. What must I do to remedy it? Will it be advisable to feed copperas or lye, with the garbage and what proportions, and how often?—Subscriber, Alberhill.

This query was referred to Prof. J. I. Thompson, who answers:

"In reply to the inquiry concerning the feeding of bran with garbage to pigs, I think two things might be the cause of the scours. Your correspondent does not state where the garbage is secured, but if it contains much lye and washing powder, that is probably the cause of the trouble. Should not consider bran the proper feed to add to the garbage even though no trouble was experienced. The garbage itself is undoubtedly bulky and bran is also rather too bulky for hog feed. In case the pigs would seem to need more protein for proper growth would suggest that tankage be supplied in self feeders. If they do not fatten rapidly enough would add a little grain, preferably barley or corn, if they can be secured at a reasonable price.

"If any copperas is to be fed would feed a reasonable amount for two or three days and then discontinue it entirely."

Disinfectant

When marking boar pigs will it be advisable to use disinfectant and what kind?—Subscriber, Alberhill.

At castration time we use liberal amounts of a disinfectant, preferably some lysol solution which can be secured at almost any drug store, and the proportions for its use are on the package.

Rebudding Lemons

Have five acres in Orange County set to two and three-year-old lemons but as I have decided this section is not especially adapted to lemons, while Valencia oranges do thrive particularly well, I contemplate changing over to the latter. Which would be the most practical and economical method, to set the orange trees between the lemons, leaving the lemon trees until the Valencias begin to bear, or budding the lemon trees to Valencias? The most of the trees which I wish to replace are small and if budded low would have only an inch or two above the original bud, leaving but very little lemon wood. From an economical standpoint would prefer the budding as it would save quite a little outlay for trees. However, I do not want to make a mistake.—Subscriber, Santa Ana.

If these are young trees, as appears from the suggested plan of budding just above the ground, and especially considering the fact that citrus trees are comparatively low priced, we would re-set with regular nursery trees. Good, thrifty trees can be had and come to bearing quicker than these others with the care they might get in orchard form. On the other hand, if the trees were lusty bearing trees then they could be changed to bearing orange trees quicker than the young ones would mature and perhaps enough quicker to compensate for cost of re-budding and the two or three years of careful attention required to get the tops in good condition. We believe in using Valencia on orange sour root there would be less liability of damaged trees from gum disease. However, we would hesitate before changing Orange County lemons into Valencias. Lemons are good property—for the stayer.

Raising Poults

A baby turkey four weeks old started to limp. In two days it had lost the use of the right leg. It seemed paralyzed. In about ten days the left leg became helpless also. It died about three days after. Now another turk has started the same way. Feed curd with onion tops and hard boiled eggs mixed in it. Do you know of any remedy for this trouble?—Subscriber, Calexico.

If curd, onion tops and hard boiled egg are the only food the poults have received, the trouble must be due to a lack of bone and muscle making material. Rolled oats, bran and bone meal are all frame builders and should be part of the ration. At the Rhode Island station the poults are started on egg, but this is given for two weeks only. On the fourth day green feed is added to the egg. On the fifth day rolled oats are added and are continued through the sixth week. On the ninth day mash feeding is begun. the mash consisting of six parts corn meal, four parts wheat bran, two parts middlings and one part linseed meal. I think bone meal could well be substituted for the linseed meal. Beginning with the third week a mixture of finely ground grains is given. After the tenth week this is replaced by equal parts of corn and wheat. The feeding of sour milk begins about the tenth day and the amount is gradually increased as the birds become older. Up to the end of the fifth week the birds are given five meals a day, only a very little being given at each meal. The three main meals, morning, noon and night, consist of a mixture of mash, grain and green feed, we are not told in exactly what proportion, but I should mix them in equal parts. In the middle of morning and afternoon the poults are given curd or cottage cheese. After five weeks the number of meals is reduced to three. If the poults are on range they need not be fed so often, but the ration must contain some grain, both whole and ground. As your poults are already over five weeks old two or three meals per day, depending on the amount of feed they get on range, will be sufficient. Let them have in the morning and at noon a feeding of dry mash consisting of six parts corn meal, four parts wheat bran, two parts middlings, two parts rolled oats and two parts bone meal, with cracked wheat and cracked corn at night and sour milk before them most of the time. This ration, if they are not overfed, will help to develop the muscles and strengthen the bones of their legs. If they have not an abundance of green feed on range, lettuce and chopped onion should be added to the mash. I have heard of turkeys being raised successfully on a diet of bran and onions and have myself raised them on little else but chopped greens and rolled oats. In fact, a mixture of rolled oats, onions and cottage cheese makes a very good ration for poults that have been well started.—J. A. K.

English Sparrows

Please advise best method of protecting young vegetable plants from the depredations of the English sparrow. Am told that strychnine will not poison them.—Subscriber, Porterville.

The English sparrow pest has put up a long question to producers all over the country. They make a fine dish for the table and where one can do so their ranks may be thinned by the use of a small shotgun. A system of trapping, showing plans of different traps, is outlined in Farmers' Bulletin 493, "How to Destroy English Sparrows." Anyone troubled with the pest should get this bulletin. It was published in 1912 and may be out of print but doubtless the department has issued others to replace it. As to poisoning, there is no way of poisoning the pest which does not also endanger song birds, poultry and other domestic stock. A poison which works satisfactorily is made by dissolving one-third ounce strychnia sulphate in a glass of hot water, add three teaspoons starch, heat until the starch begins to thicken, this mass to be poured over a quantity of wheat or kafir corn, or similar grain, stirred and dried. It is said that if the strychnine is used according to this method it will be effective.

"Standard" Plumage

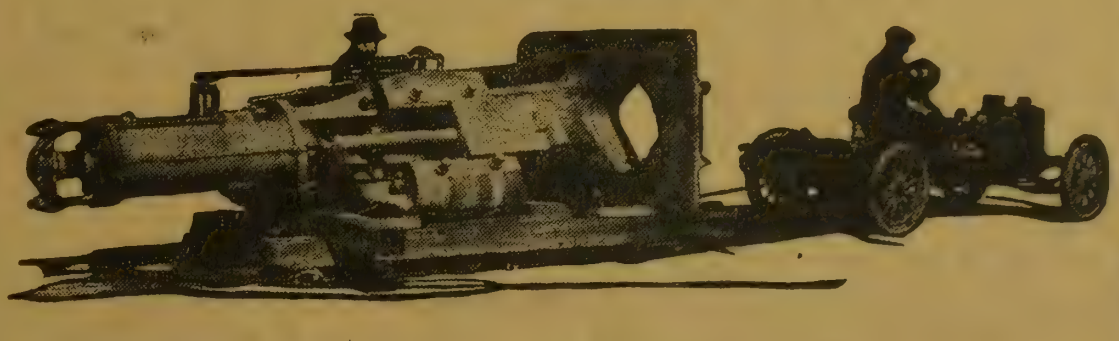
Should a White Orpington cockerel have brassy feathers? Should a Barred Plymouth Rock cockerel have any light feathers at tips of wings?—Subscriber.

"Feathers other than white in any part of plumage" are one of the disqualifications in White Orpingtons, and this includes brassiness, which is a disqualification in all white birds. In the Standard of Perfection's description of color in Barred Rock males and females we read: "Grayish-white, each feather crossed by regular, narrow, parallel, sharply defined, dark bars that stop short of positive black; free from shafting, brownish tinge or metallic sheen; the light and dark bars to be of equal width and to extend throughout the length of the feathers in all sections of the fowl." At the tips of the wings of the male the bars are farther apart than in other sections, but each feather, in the ideal bird, is barred to the skin.—J. A. K.

Vegetables for the Desert

Please give best varieties of vegetables, such as string beans, peas, potatoes, sweet potatoes, onions, etc., for the Mojave desert. Would you advise the use of farmogerm?—Subscriber, Hinkley.

With right soil conditions and plenty of water we see no reason why one should not grow practically all the vegetables needed on the Mojave desert. Those mentioned and practically all other common garden vegetables should do well. It is a matter of fitting the vegetable to desert culture and this one can do only by studying local climatic conditions. At this period of the year we should think all vegetables might well be planted. The heat of summer might make it more difficult but crops planted now would be out of the way before that time. As to use of farmogerm, or any of the bacterial cultures, that would depend upon the particular legume to be raised and whether your soil needs it. With alfalfa we would certainly make a test plot, with another plot on which the



This proves, more powerful than words, the great pulling power of the Chalmers. A short time ago a big steam hammer arrived at the Chalmers works. It weighed in excess of 30,000 pounds. After it was unloaded from a freight car it had to be moved to a building a quarter of a mile away. A Chalmers chassis, just finished, was taken from the factory and a towing rope attached. Several times the rope broke and the steel rollers placed under the hammer were crushed like eggshells. The Chalmers, however, hauled the load with ease, and the hammer was in place in an hour.

Cutting Costs in California

That is the every-day job of the GASPULL—cutting California farming costs.

Its light weight means handiness and economy in operation, its 15-30 motor meets the average power demands, its low price makes its exceptional value.

The GASPULL weighs only 11,000 pounds and will turn on a 15-foot circle. An inspection of it will show its efficient lubrication and well protected parts, its convenience of handling, its well made powerful motor.

The GASPULL is an all year around power plant able to handle all your farm jobs, draw bar or belt, with readiness, economy and satisfaction.

Ask our nearest branch for catalog and price—then you'll quickly see the extra value you get in your GASPULL investment.

In the Advance-Rumely line are the famous Rumely Ideal grain and rice separators.

Speed-Governing Line Shaft Takes the Kick Out of the Engine

TO GET ALL THE CREAM

You know it is important to have your separator work with the least vibration. It is also necessary to regulate the speed of your churn and washing machine. The Cedar Rapids Line Shaft absorbs all vibration. And you can regulate the speed of your machinery without stopping your engine or motor. This means money to you. Get catalogue. Investigate.

Address Dept. W, Cedar Rapids Foundry & Machinery Co., Cedar Rapids, Ia.

Request your storekeeper to supply the goods advertised in the California Cultivator.

culture has not been placed. Then the first year will probably show whether its use is beneficial. The only garden crops on which the cultures would prove beneficial would of course be the peas and beans.

Phylloxera

Would like to see an article in the Cultivator on control of phylloxera.—Subscriber, Morgan Hill.

About the only method of control of phylloxera, other than planting pest-free vines on soil which is not infested, is by the use of resistant stocks. We believe there has been no effective remedy for a vineyard which is already infested. When vineyards are on sandy soil carbon bisulphide may prove fairly efficient, but it must be applied with care. It is extremely explosive. Where one has an abundance of water, flooding the vineyard and keeping the ground covered with water for the period of a month or more in the winter will help to exterminate the pest.

Distance from Line

I am going to set out a hedge. How close can I set to the property line? Is there any law in regard to this?—A Subscriber.

There is no law yet enacted which touches upon this question. Of course the question of damage might be settled in the courts, that is, if one plants trees which injure neighboring property it is probable the owner of the land could recover such damage as may be actually proven.

Manure

Kindly tell me which manure is best, that of the horse or cow, and which of the two will be beneficial for the greatest length of time.—Subscriber, Anaheim.

As a general thing we may say that horse manure is quicker in action or, as often expressed, cow manure is "colder" and not so quickly assimilated by the soil. For that reason presumably the action of the cow manure would cover a longer period. In either case, however, the fertilizing value will depend very largely upon the feed. Taking average samples as far as possible, Van Slyke's "Fertilizers and Crops" gives one table in which the percentage of plant food constituents in fresh animal excrements is shown to be, for the horse .70 per cent nitrogen, .25 per cent phosphoric acid and .55 per cent of potash, while that of the cow is .60 per cent nitrogen, .15 phosphoric acid and .45 potash. This lower percentage of the cow manure is partly due to the fact that it contains a larger percentage of water, that is 86 as against 78 per cent for the horse manure. Another table in the same book gives the value of horse manure per year for each thousand pounds of animal to be $29.60, for each cow $32.60. The weight produced by the horse being about 24,000 and by the cow about 30,000 pounds. In each case of course the straw used in bedding entered into the computation.

Agriculture in the Imperial Valley

How California can now adorn and delight the American family table with such novel fruits of the earth as dates of unfamiliar types, Japanese persimmons, jujubes, Spanish mulberries, kumquats, the roselle, and the cassava (from which tapioca is made, is told in a new bulletin on "Agriculture in the Imperial Valley: A Manual for Settlers," written by Walter E. Packard and obtainable free by writing College of Agriculture, Berkeley. The university's object in issuing this manual is to give settlers in the agricultural wonderland reclaimed from the desert the results of five years of scientific investigation at the Imperial Valley experiment farm established at Meloland in 1912.

"Its feet in the water, its head in the fire," the date palm has flourished marvelously as an immigrant to the reclaimed desert of Southern California from Northern Africa and the Persian Gulf. It has been shown that dry or "bread dates" can be produced so cheaply that they would be profitable if sold for a very few cents a pound, while others, such as the famous Deglet Noor, demand such care and skill in their production that they command sale as a confection at prices as high as the choicest of candies. The Arabs have never developed the date by scientific selection, so work of great interest is being done by California date growers in planting seedlings, retaining only the best of the resulting plants, and thus starting the development of new California varieties of dates which in time will win world fame.

The fact that figs will ripen on the desert as early as May, and early table grapes in June, means that "every man's own vine and fig tree" will be a proverb full of meaning in the Imperial Valley.

The development on the desert of cotton, another newcomer in California, has been highly successful, but has been hampered by the fact that too many types of the race have come, and that the resulting hybridization has been a difficulty. The university particularly recommends the Durango long-staple cotton, which commands a premium of from two to six cents a pound over short staple cotton. California cotton commands a premium over cotton grown in the South because of the greater whiteness of the fibre.

Six thousand cars of cantaloupes were shipped from the Imperial Valley during May and June, 1915, and watermelons ripen by June. Barley, the most successful grain crop of the valley, ripens early enough to be followed by a crop of corn or of milo maize, the sorghums thriving during the heat of the desert summer.

Besides telling how to raise fruits, vegetables and field crops, Mr. Packard gives much valuable information on planning a rotation system, so as to maintain the fertility of the soil and prevent the growth of weeds, on the controlling of desert pests, such as grasshoppers, plant lice, the alfalfa worm, or the "farmer ant", which sometimes kills not only alfalfa or vines, but even—so some claim—young pigs—and on the importance of making soil-borings from time to time so that the farmer may know whether he is giving the soil as much irrigation as his crops need, and—equally important — not too much water, for too much irrigation is not only wasteful but harmful.

REPORT OF STATE WATER COMMISSION

The first report of the state water commission, which is just from the hands of the printer, covers a period from March, 1915 to December, 1916, a little less than two years. Among many other things it shows that agriculture tops the list for use of water by the overwhelming percentage of 93 per cent of the total amount applied for. Power represented five per cent, mining 1 7-10 per cent and municipal supply 3-10 per cent. The following are the amounts applied for for all purposes, given in the unit of second feet, which should be multiplied by 40 to give the equivalent in miner's inches: Agriculture, 91,360 second feet; power, 4892 second feet; mining, 1624 second feet; municipal supply, 257 second feet.

WOOD-STAVE PIPE

The Rural Engineering Division of the United States department of agriculture has issued a professional paper in Bulletin 376, touching upon the flow of water in wood-stave pipe. It is by Fred C. Scobey, Irrigation Engineer, assisted by six other engineers. As noted, this is a professional paper and of practically no interest excepting to engineers. The introduction, however, is interesting, and from it we quote:

"During the past ten or 15 years the use of wood pipe for the conveyance of water has been greatly increased. Such pipe is now quite commonly used to convey water for the irrigation of land, the domestic needs of towns and cities, and the development of power. So long as wood pipe consisted of bored logs its carrying capacity was limited to a small flow and its adaptation to a limited set of conditions, but the conversion of clear, sound lumber into staves and the making of stave pipe into sizes from 12 to 72 inches in diameter led to a great expansion in both carrying capacities and uses. More recently it has been found that stave pipe can be successfully built and operated in sizes up to 12 and 13 feet in diameter, the largest to date being 13½ feet. This great increase in size and carrying capacity has been brought about by providing yokes or cradles which support the lower part of the pipe and thus prevent its collapse.

"Being well adapted to low heads and large diameters, such pipe has proved one of the best and cheapest means of conducting large volumes of water under low or medium heads from the sources of supply to the places of use, regardless of whether the latter be a power plant, a storage reservoir, the highest portion of an irrigated tract, or the distributing reservoir of a municipality. Stave pipe is also frequently used in the construction of inverted siphons, so called, in conjunction with canals and grade pipe lines, to convey water across gulches, ravines, or other depressions or down chute drops to lower levels. It is likewise well adapted to rolling ground where the building of canals on grade might be impracticable. Finally, in the smaller sizes it is often used to convey and distribute water to orchard tracts, manufacturing plants, and municipalities.

"The present economic importance of stave pipe in this country, which arises from its adaptation to so many diverse uses, its wide range of capacities, the ease with which it can be laid on rough ground, and its cheapness when compared with other pressure pipes, has led this department to investigate and report upon its merits and demerits."

In one of the conclusions, of interest and perhaps surprise to most of us, is this: "Wood pipe will convey about 15 per cent more water than a ten-year-old cast-iron pipe or a new riveted pipe, and about 25 per cent more than a cast-iron pipe 20 years old, or a riveted pipe ten years old."

Book Review

FOR THE COTTON BELT

"Field Crops for the Cotton Belt", by James O. Morgan, professor of agronomy, College of Texas, published by The Macmillans, New York, at $1.75.

For years there has been appreciation of the fact that if the South is to prosper as it should it must diversify. It has pinned its faith almost exclusively to cotton, and years similar to the past have been most profitable ones, but such years are far between, and experts of the department of agriculture and far seeing residents of Southern states are giving serious consideration to the problem of diversified farming for cotton growers. This book aims to meet this demand and be helpful to the farmer who would prosper. There are 38 chapters in the 456 pages. The first chapter classifies and gives the value of various field crops, several chapters then discuss the cotton plant, various species and varieties, cotton breeding, climatic adaptations, fertilizers and minerals, tillage, harvesting and marketing; then comes a series of chapters discussing other crops such as Indian corn—and to this crop several chapters are given—oats, wheat, rye, barley, rice, sorghums—both grain and saccharine—sugar cane. Most unfortunately, we believe, the author leaves out discussion of the most important of all "crops", such as beef, pork and dairy products. It has, however, a fund of information touching upon conditions in cotton growing states.

APPROPRIATION FOR DAVIS FARM

The board of directors of the Sacramento Valley Development Association has endorsed the recommendation to the legislature that $620,000 be appropriated for the Davis farm of the University of California to be expended as follows: Creamery, $100,000; building and equipment for animal husbandry, $60,000; water supply, irrigation distribution, sewerage disposal and fire protection, $15,000; minor structures and repairs, $15,000; agricultural engineering, $50,000; dean's residence, $10,000; greenhouses, $10,000; total, $260,000.

"Think of it! The price hasn't gone up for these fine Clothes!"

Yes, think of it! It will pay *you* to look into this, see the fine clothes, try them on, and then be astonished that such fine style and sturdy wearing qualities can still be bought for $17! A great demand centered on this suit of one nationally-known price has enabled the makers to effect great economies and keep the price $17, as before. Get *your* suit today!

You know the price *before* you go into the store—$17 always, everywhere. Watch your local newspapers for advertisements of the nearest Styleplus Store. Look for Styleplus in the Store Window. Look for the Styleplus Label in the coat collar. If there should not be a Styleplus Store in your town, ask your favorite dealer to order a Styleplus suit or overcoat for you.

Style plus all wool fabrics + perfect fit + expert workmanship + guaranteed wear

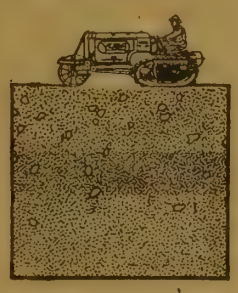
BUY A YUBA

What kind of soil have you?

Adobe?

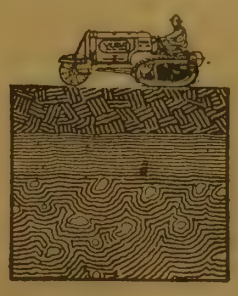
Do you plow it dry? The Model 20-35 has the power to pull the Yuba 6-disc plow—and the plow cuts as deep as you wish. Or wet? The Yuba is the only machine with the traction to harvest rice on wet adobe.



Sand? Admittedly a hard soil for any tractor. Frankly the upkeep of the tractor will be somewhat greater. But, and this may surprise you, the Yuba Ball Tread wears very little faster under these conditions. The reason? Less bearing surfaces to grind away and better steels to stand the wear.

Tule?

The Yuba is a favorite for breaking tule land. The high clearance of the Yuba disc plow keeps it from clogging up. The Model 20-35 and plow form a "one man outfit."



Loam? First on the field and last to leave, the Yuba, with its light weight and generous traction area can go on the ground pretty much where you wish. Nor will it pack the soil.

In any soil the Yuba outfit — a Yuba tractor and a Yuba plow — have points of distinct advantage. Write us your conditions and let us tell you something of what you may expect the Yuba to do for you.

Yuba Manufacturing Company
(*Formerly The Yuba Construction Company—change in name only*)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Tastes differ, but for a California roadside tree none equals the olive. We are aware of the beauty of the Himalayan cedar, said by some to be the most beautiful tree in the world, and of many other purely ornamental trees like our eucalyptus and pepper. Yet the olive is not only beautiful in form, in its shade of green and its beautiful trunk, but it will continue to grow and thrive for generations. Besides there is possibility of return to the property owner or the county which might well maintain thousands or hundreds of thousands of trees along its highways. Let us plant more olives.

The cover this week shows a bit of avenue planting which will be seen faulty in that the trees are planted entirely too close together and the avenue is too narrow. But there is promise in this view of the beautiful things in store for California if she will but plant the trees which the Mission fathers brought to the state.

AN APPLE A DAY

A subscriber in the North signing himself "Apple Dad" sends a clipping from an Eastern newspaper in which the big red apple and the little red school house are urged as educational factors. It says that this is an age when the value of preparedness and the necessity of retrenching have been demonstrated. The article then goes on to say that we need to fortify our children not only with intelligence and learning but with best of health, which may be secured by the eating of plenty of fruit. In fact, going one better than "An apple a day keeps the doctor away" he suggests that two apples a day be given to every attendant of the little red school house.

ORANGE DAY

Our date of issue is also the date on which the orange is to rule the United States. First of all the fruits to declare itself worthy of a special day observed in its honor, it has secured perhaps the most general recognition of any. Lovers of the apple—and that includes all of us—insist that an apple every day is sufficient to keep the doctor away and that the apples of gold shipped from this state, almost by the hundreds of carloads every day in the year, make Orange Day extend from November 1 to October 31. The California Cultivator can now do nothing more to boost for the 1917 Orange Day, but we may call attention to other days in other years to come.

There has been limited planting of oranges for the past few years; some orchards have been eliminated because of the growth of progressive California cities or possibly because of unfortunate selection of site. One who has land fitted for orange culture may well consider future demands for this luscious fruit.

ANTI-TORRENS

The banks of Orange County, after various whereases, declare:

"Whereas, such property so registered may be offered to the banks of Orange County as securities for loans or credits.

"Now, therefore, be it resolved by the Orange County Bankers' Association that certificates of title issued in accordance with the provisions of said act, which is known as the Torrens title law, will not be accepted as evidences of title by this association unless also accompanied by an unlimited certificate of title made by a responsible abstract or title company."

Yet the banks ask why farmers are not content with the present financial conditions. This is a most pointed answer.

If there is weakness in the present Torrens law of California the banks might well join in strengthening it rather than in an effort to nullify it, for one of the heaviest taxes upon the borrower is the expense of making his loan. If the banks of the state would encourage agriculture let them simplify this matter of rural credits.

BUILD SILOS

It is almost universally conceded that the cheapest dairy feed on earth is silage, yet California has fewer silos than any other section where dairying is as important an industry as it is here. The explanation often given is that we grow green feed the year around. Yet the owner of the silo who grows the right crops and carefully stores his ensilage almost invariably continues the practice. Our great crop, alfalfa, is one of the richest dairy feeds, but it needs balancing, and concentrates are now sold at war prices which are prohibitive except for feeding to highest producing cows. Silage is not only valuable to balance the ration; it is a good conditioner, and the stock eats ravenously of it.

There are all kinds of silos from low priced to high priced. Build which you prefer, but build a silo. There are 6,000,000 less cows in the United States than there were 15 years ago, and there are 24,000,000 more people. None of this loss has been in California, for which we should all be thankful, and while California's dairy production will not increase sufficiently to overcome the loss in other sections of the country, she may, by proper use of her resources, enter more largely into this most dependable of all agricultural pursuits.

SPUDS

We note the coining of a new word. We have had aristocrats, plutocrats, and various others; now comes the potatocrat. The best of it is there seems to be a general scramble of the common people to enter the class; all are growing potatoes. Eugene Grubb of the Southern Pacific is in his element and, strange as it may seem, is giving warning to the would-be potato growers to learn the requirements of the class which they would enter.

Ordinarily the United States produces less than 400,000,000 bushels of potatoes. Last year there was a shortage in supply and an increase in demand. The shortage is perhaps due more to pests and diseases of the potato than to any other one cause. New fields are being developed, and we hope this shortage will be recovered.

California is well toward the top in the total production, though she only produced 10,000,000 bushels. There are two or three large producing states, New York heading the list with nearly 50,000,000 bushels. Pennsylvania, Ohio, Michigan, Wisconsin, Minnesota, and one or two others are in advance of California. California has its troubles in potato growing, and these will be somewhat increased this year because of the great increase in number of producers. These producers have some lessons to learn, and we hope our potato experts will pass on the information which will reduce losses to the minimum.

HOGS

Well wishers of California have for years been calling for more hogs, more beef, more mutton, more milk, more everything along the live stock line. "They are needed to balance agricultural interests in our fruit growing sections; they are needed for their direct wealth bringing power; they are needed because they make a state more independent". And the live stock industry has responded to these appeals and has grown and is growing, and seemingly every effort has been made to induce further growth.

Now, however, comes the board of supervisors of Los Angeles County and puts a penalty on every hog. The hog—at least in large numbers—must not be kept within a mile of any little hamlet; he must be fed on sterilized tables; he must pay a fee for a physician or manicurist to call and inspect his manner of living, and if various regulations are not complied with his owner may pay a fine of $500.

The board of supervisors of Los Angeles County has perhaps given a paying position to some politician, but we believe it has exceeded its rights, at least from the standpoint of justice, in placing upon this branch of the live stock industry such a burden. Inspection is made of our cattle, our trees and plants and seeds and the county or state bears the expense. The hog must pay his own way and hire a politician. We believe there should be reasonable regulation of all these matters, and we believe the expense should be placed where the horticultural law places it, and not upon the man who is endeavoring to respond to the call of all of us by producing more and better live stock. Such a law, or ordinance rather, may stick when the courts take a turn at it, but we hope not. The swine breeders are so busy producing better hogs that they have no time for such a test.

Agricultural Notes

Hogs touched the 11-cent mark in Chicago last week.

The cold season in the East is making a late maple sugar season.

All supplies of rice received in England are now under government control.

Australia has put through a daylight saving bill which went into effect January 1.

More attention is being given to cattle raising in Tennessee and other Southern states.

Texas has 12,000 acres in onions this year, an increase of 2000 over the planting for 1916.

The annual meeting of the American Guernsey Cattle Club will be held in New York May 16, 1917.

The university farm at St. Paul has demonstrated that raising pigs brings profit of five cents a minute.

Exports of cotton from the United States to date of February 10 amount this season to 3,165,110 bales.

San Angelo, Texas, is planting pecan trees for shade along its streets. Over 2500 were planted during the past season.

Italy has almost 6,000,000 acres devoted to olive culture. The olive oil yield for 1916 was about 375,000 pounds.

The Hawaiian experiment station is cooperating with stations in California and Florida in experiments in the growing of the Chinese litchi nut.

Cuba exports considerable quantities of honey. Last year's shipments went largely to the Netherlands, though the United States bought about $100,000 worth.

The embargo of railroads and the scarcity of cars is interfering seriously with the movement of farm produce to market, and this at a time when prices were never so attractive.

The United States imported more than $3,000,000 worth of bean oil from the one port of Dairen, Manchuria, during 1916. Only $400,000 worth came from the same point in 1915.

American export trade to South Africa has been much increased since the beginning of the war. In the first six months of 1916 it was estimated to have increased by $5,000,000 value.

The Pennsylvania Railroad is collecting waste paper at stations and on trains and has installed baling machines which put the paper in shape for handling by the mills. Other railroads are following suit.

An increase of 25 per cent in the grazing fees on all national forests, instead of 33 1-3 per cent as was originally contemplated, will be made for the season of 1917. Subsequent increases will be based on study of local conditions.

Regarding wheat prospects Illinois reports winter wheat still looking well; Michigan, acreage same as last year and crop in good condition; Ohio, thawing and freezing bad for crop; prospects generally for wheat production the country over not as bright as hoped for.

The state experiment station at Pullman will soon issue a bulletin on "A Soil Survey of the Proposed Palouse Irrigation Project," including a detailed survey of the 103,000 acres of land in southern Franklin County, which may at some time be put under irrigation with water from the Palouse River.

Agricultural News Notes of the Pacific Coast

Northern California

The fair at Chico will be held May 21-26.

Cloverdale had a big citrus show last week.

Dates of the Glenn County fair have been named, September 19-22.

Four thousand acres has been sown to barley on the big Stanford Ranch at Vina.

The university farm picnic, held at Davis every spring, will take place this year on April 28.

The boys' agricultural club of the Placerville high school has started a potato growing contest.

The Tehama County farm loan association has asked the supervisors to secure a county farm adviser.

Sheepmen of Shasta County are reported selling wool on the backs of their sheep for 38 cents a pound.

It is announced that Ruby and Bowers are going into the cattle business. They will handle Shorthorns and Herefords.

The Glenn County Live Stock and Agricultural Association has elected J. J. Flaherty, president and E. A. Kirk, secretary.

A Chico grain buyer has started the marketing of rice straw. It is baled and used chiefly for packing purposes and as bedding for cattle.

The price of jute bags manufactured at San Quentin has been fixed at ten cents. The penitentiary expects to deliver between 3,000,000 and 4,000,000 bags.

Four hundred crates of Japanese onions came into San Francisco last week. This reverses the usual order as California has been exporting to Japan until recently.

Hop buyers are in the field trying to make contracts for the 1917 crop on a 10½ cent basis. Members of the Hop Growers' Association, however, are refusing to sign up at this figure.

The Mt. George farm center of the Napa County farm bureau gave a banquet in honor of the visiting farm adviser's conference on Tuesday evening, February 20, in the farm center hall.

The Arbuckle-College City Almond Growers' Association last week held its annual meeting, electing C. B. Morrison, president; D. S. Nelson, secretary, and H. H. Dopkins, representative of the state exchange.

A number of damage suits have been brought against reclamation districts 108 and 787 and the Knights Landing Ridge Drainage District, as a result of the cutting of Knights Landing Ridge, which lets in the waters of Colusa Basin on the lands of the plaintiffs.

Central California

The raisin dryer at Parlier has been burned, destroying about 70 tons of raisins.

The average price paid for January butter fat by Kings County creameries was 42 cents.

The proposed Madera irrigation system includes construction of three 400,000 foot reservoirs.

Stockmen of Tulare County are planning a stock and swine show to be held in Visalia this fall.

San Luis Obispo has taken the bounty off squirrels and coyotes, as a measure of retrenchment.

Tulare County stock growers have organized the Tulare County Pure Stock Breeders' Association.

A number of dairymen of Kerman have enrolled in night dairy classes of the Kerman high school.

Supervisors of Kings County have opposed the plan to establish a drainage district in the Island reclamation district.

Directors of the California Peach Growers' Association have decided to erect peach packing plants at Kingsburg and Parlier.

The California Associated Raisin Company shipped out last week 50 carloads of raisins. Freight rates were increased from 90 cents to $1.00 per cwt. on March 1.

Director Lookwood of the Turlock Merchants and Growers' Association is urging cantalope growers to cooperate in hauling their crop to market, thus effecting material economy.

The Fresno County Agricultural Association has increased the number of its board of directors from seven to 17. The next district fair will be held the first week in October.

The exhibit of the San Joaquin Valley Counties' Association at San Diego has been removed to San Francisco, where it will be kept as a state exhibit in the exposition auditorium.

According to report of County Horticultural Commissioner Ladd of San Joaquin the fruit output of 1916 was cut down to 80 per cent of that of 1915. Much better prices were secured, however.

At a recent meeting of the county horticultural commissioners of the San Joaquin Valley a law against tight packing of grapes was approved, as was the licensing of all sprayers and fumigators.

Fig growers of Stanislaus County, in a recent meeting at Ceres, effected a permanent organization. The growers will endeavor to standardize their product and market Stanislaus figs under a special brand.

Southern California

The Hemet Farmers' Club met on March 1.

A cannery is to be built at Arlington, Riverside County.

Five high schools in the Imperial Valley have pig clubs.

There are now six farm loan associations formed in Imperial County.

There is a proposal to establish a citrus pre-cooling plant at Orange.

The California Walnut Growers' Association received for its 1916 crop $3,000,000.

The stock of lima beans in warehouses is only about half what it was last year at this time.

Members of the San Antonio Growers' Assocation received $15 a ton for their tomatoes last year.

The Chile pepper crop of Garden Grove is reported to have brought the growers about $121,000.

Pear growing is proving profitable in the Imperial Valley, one grower gathering 40 tons from 20 acres.

The Sugar Beet Growers' Association of Southern California held a meeting at Artesia the evening of February 27.

The highest price ever paid in Fillmore for beans is said to be 8½ cents, paid to the Fillmore warehouse for limas.

A new cottonseed mill has been opened for business in Los Angeles and is turning out 4800 gallons of oil daily.

The Garden Grove Citrus Association has purchased land and will commence the erection of a packing house.

The cannery of the California Growers' Association at Hemet is being put in shape for the apricot and peach crops.

At the recent meeting of the Riverside County Beekeepers' Club at Riverside a score card for judging honey was adopted.

Apricot growers of Hemet gathered on Tuesday evening, February 20, to form a local association of the Prune and Apricot Growers.

The chamber of commerce of Northern San Diego County held an all-day meeting in Fallbrook recently at the Red Mountain ranch.

Nearly 37,000,000 pounds of walnuts were imported into the United States last year but California nuts sold at prices 35 per cent higher.

Garden Grove, Orange County, shipped to Los Angeles canneries the past season 1500 tons of pimientos and 1000 tons of green chiles.

A lemon pruning demonstration was given by H. S. Lee to the Riverside experiment station in the grove of S. Douglas of Covina. A number of Covina lemon growers were present.

The Coast

There will be a fat stock show at Fort Worth, March 12-17.

Culture of broom corn is arousing much interest in the Southwest.

Bannock County, Idaho, has made appropriation for support of a county agriculturist.

Seattle reports a heavy supply of low grade apples as seriously affecting marketing prices.

Farmers of the Chandler district of Arizona have organized an association with H. P. Clark as president.

The wool crop of the Yakima Valley is much heavier than last year and will be of better quality, according to recent reports.

Cotton growers of Chandler and Tempe, Arizona, are asking county aid in bringing in laborers to help in picking the cotton.

Survey has begun of the first forest road to be constructed under the federal aid road act. This will be in the Apache national forest of Arizona.

During the past year the cooperative creamery at Kennewick, Washington, has paid farmers better than one cent above the market for butter fat.

Dr. B. J. Cady, cholera expert of the United States department of agriculture, is at present working in Kings County to control the outbreak of hog cholera.

Arizona cattlemen are much gratified over the announcement of the secretary of agriculture that the advance in grazing rates would be 25 instead of 33 1-3 per cent.

A farmers' cooperative grain elevator has been built at Centerville, Washington. It will save the farmers about six cents per bushel on their sack bill alone.

Live stock men of the Northwest held meetings at Spokane February 22, 23, at the call of the Spokane chamber of commerce to discuss impending live stock legislation.

It is reported that 2000 horses now in stage service in Yellowstone Park will be sold into the army service and automobiles installed to take their place in the park.

More than 65 prune growers assembled at Vancouver (Washington) and appointed a committee of three to formulate plans for a prune growers' union or organization.

The Idaho-Oregon Honey Producers' Association will establish a warehouse at Caldwell, Idaho, to handle bee supplies. Ten thousand dollars' worth of supplies will be purchased as a start-off.

The Farmers' Union Warehouse Company of Palouse, Washington, has paid $15,000 for potatoes since the crop came in, and with other shipments it is estimated that $25,000 worth of potatoes have been shipped out of Palouse during the season.

A SILO

to be effective must be made of CLEAR, SEASONED REDWOOD, with each piece machined exact and put together by mechanics who have made a study of silo construction.

A GOOD REDWOOD SILO

will last indefinitely. It will pay for itself every year, while a poor silo, made of inferior woods, will be a constant source of expense, loss and disappointment.

THE REMCO SILO

is made from CLEAR, AIR DRIED REDWOOD STAVES, cut to exact size for the circle and erected by the most skilled mechanics obtainable.

Let us tell you why you should buy a REMCO REDWOOD SILO for satisfaction and profit. Catalogue on request.

IRRIGATION PIPE. ALL SIZES IN SEASONED REDWOOD—the wood of permanence. TELL US YOUR WANTS AND WE WILL AID YOU.

1604 HOBART BUILDING SAN FRANCISCO, CAL.

Santa Anita Rancho

Anoakia Breeding Farm

ARABIAN-THOROUGHBREDS: Two-year-olds, sired by imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Geische Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

Cow Testing in Imperial Valley

Written for California Cultivator By Paul Short

IMPERIAL Valley, though long known for its great production of alfalfa, is rapidly coming to its own as the leading county as a dairy region.

In a comparatively short time an enormous number of cows were shipped into the valley. Among them were many good herds and high producing cows and also many poor ones and culls from other districts. Many breeders and dairymen have felt the need of a higher standard of milk and butterfat production. To attain this end the Imperial County Farm Bureau, working for the farmers, organized a cow testing association. The number of dairymen joining was larger than anticipated, and the number of cows signed up totalled 4000, forming the largest cow testing association in the world and requiring the services of four testers who are now at work in the valley.

The association is divided into units according to locality, and each is handled by one man. The charge of one dollar per head per year covers the expense, each cow being tested once a month. Testing was commenced in November, 1916.

Some interesting data was brought to light by the first few months tests. During the rainy months of January 65 of the 4000 cows gave over 45 pounds of butterfat; 36 gave over 50 pounds, and ten cows gave over 60 pounds of butterfat, or two pounds per day. Notwithstanding this fact, the purebred Holstein herd of C. Darnell has entered the state dairy cow competition in the California Cultivator contest for highest average yearly production of herds in cow testing associations.

F. Vander Poel's Jersey cow, No. 1853 headed the list of high producers with 89.51 pounds of butterfat for the month.

Much service is rendered the dairyman in picking out the low producing cows, and already some men have culled out some of their low producing cows and found practically no difference in the cream check.

Considering the fact that there has been a feed shortage in Imperial Valley that has affected practically every dairyman, and many seriously, the production for the entire number of cows is comparatively high to that of other sections of the state. These facts emphasize the importance of Imperial Valley as a dairy region. The outlook for the future of Imperial Valley is certainly good.

Feeding Sorghum Grains

THE Middle West has done some consistent experimenting with the feeding of sorghum grains. These experiments have shown that the grain belt is not the exclusive producer of the finest of pork, and at low cost of production. The Kansas experiment station makes report regarding some of these experiments, from which we quote:

"Milo, kafir, and feterita are the sorghums recommended. They must, of course, be fed intelligently. Because of their deficiency in both protein and fat it is advisable to supplement them with shorts and tankage for fattening purposes. These feeds were compared with corn and different methods of preparation used to determine economical methods of utilizing them.

"Eighty thrifty stock hogs, farrowed in April and May, were started in this test November 21, 1914, at an average weight of 140 pounds. They were divided into eight equal groups similar in size, condition, thrift, and type, and were fed for 74 days.

"In the first five lots the ration consisted of shorts, 30 per cent; tankage, 5 per cent; and 65 per cent of kafir, feterita, milo, kaoliang, and corn respectively. In lot 6 whole kafir with an amount of shorts and tankage, equivalent to that fed in lot 1, were given to the animals. In lot 7 the hogs received kafir heads with an amount of shorts and tankage equivalent to that fed in lot 1. In lot 8, 50 per cent of ground kafir and 50 per cent of shorts were fed.

Milo Tops Other Sorghums

"The results secured, as shown in the table, indicate," said W. A. Cochel, professor of animal husbandry in the agricultural college, 'that corn was slightly more efficient than any of the grain sorghums, but the increased gain and decreased amount of feed necessary to produce the gain were not sufficient to justify the difference in the commercial value of the grains.

" 'Milo ranked next to corn, followed closely by kafir and feterita. Kaoliang, which is a variety of the non-saccharine sorghums grown for seed rather than for forage, was much

Banker's Boy
Property of Santa Anita Rancho

less efficient than the other non-saccharine sorghums usually grown in western Kansas. It is interesting to note, however, that the feed required to produce 100 pounds of gain, where the sorghum grains made up 65 per cent of the feed, varied from 523.4 pounds to 572.1 pounds during that part of the year when the cost of producing pork is higher than at any other time. The commercial value of these feeds was much greater than usual at that season of the year. Hence the cost of feed necessary to produce 100 pounds of pork varied from $6.18 to $6.75.

Tankage Raises Ration Value

"'Although the amount and cost of the feed required to produce 100 pounds of gain are generally a fair measure of the value of a ration, it is probable that the hogs in the lots making the more rapid and more expensive gain would sell for 10 to 15 cents a hundred more than those showing less finish, and would thus give a greater total profit. The difference would be even greater on a discriminating market when there was an urgent demand for lard. As no slaughter test was conducted, it is impossible to comment on the dressed carcasses and the quality of meat from the various lots.'"

It was found profitable to grind the grains.

Feeding Value of Plants

The recent annual report of the chief of the bureau of chemistry, United States department of agriculture, shows that much work of a research nature has been done during the past year on the chemical composition of various cereals and other plants in order to form the basis for practical nutritive experiments. The proteins of the plants have been analyzed and new constituents discovered in some of them. The feeding value of plants has heretofore been estimated largely on the basis of the protein they contained. Investigations have shown, however, that the proteins in various grains and other feeds differ greatly in composition. Two cereals which contain approximately the same amount of protein may vary much in feeding value because the protein in one of the cereals contains certain constituents necessary to nutrition which are lacking in the proteins of the other cereal.

A new protein has been found in the nitrogenous compounds of kafir corn. The composition of this new protein has been determined. It contains the amino acids lysin and tryptophan, both indispensable to the normal nutrition of animals. These are not found in the proteins of maize. Now that this is known, the report states, a rational attempt can be made to learn how kafir may be fed to make it no less valuable than maize.

The peanut has been found to contain an abundance of diamino nitrogen. This form of nitrogen is indispensable to the normal nutrition of animals and is contained in inadequate amounts in the common cereals from which most feeds are derived. Peanut press cake should therefore prove to be an easily accessible material to make such cereal feeds more efficient, the report states.

Corn Smut Not Injurious to Cattle

It is a quite common belief that corn smut is injurious to cattle. Numerous experiments have been made to ascertain whether or not this is true. One experimenter started feeding two ounces a day of the smut to each of two cows. Later the amount was increased to 11 pounds. The test lasted 49 days, but no serious results were evident. The cows had a normal milk yield at the end of the period.

Other experiments have given practically the same results, so that it may safely be said that corn smut, either in the field or in the prepared ration, is not poisonous to cattle, says W. W. Robbins, Colorado Agricultural College.

But Beware of Ergot

The same authority gives the following warning regarding ergotism:

Ergot is a name applied to one stage of a fungus that works in the heads of a number of grasses. It causes one of the oldest known stock diseases, the so-called "ergotism."

The ergot stage of the fungus is abundant in the fall. It forms purple-black, straight or horn-like, hard structures about one-fourth to one-half inch long. These structures occupy the position of the grain in the head of grass. This hard mass is not a degenerate kernel of grass, however. The black ergot masses vary in size and shape, depending upon the plant attacked. They are largest in rye. Ergot develops upon a number of grasses, chief of which are cultivated rye, wild rye, wheat-grass, meadow-grass, timothy, and red-top. The injury to the grass is slight.

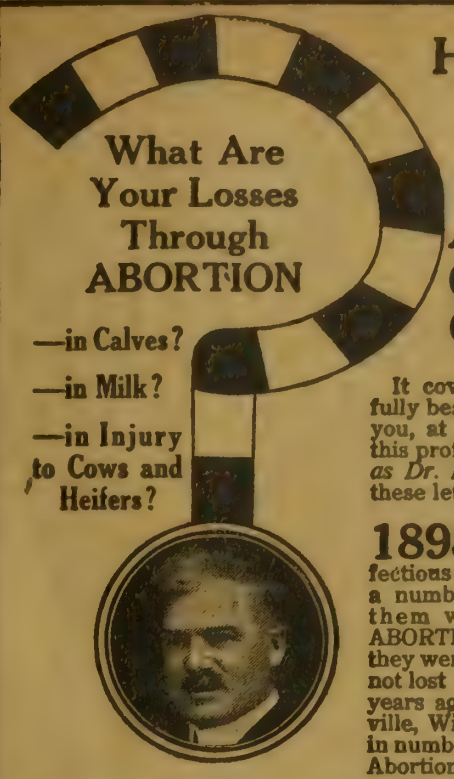
There is no effective remedy for ergotism. Hence one should become familiar with the appearance of ergot, and avoid grazing stock on badly infested areas and also avoid cutting infested areas of grass for hay.

HANDLING MILK

Milk should be kept as cool as possible, at 50 degree or lower. Do not pour it from one vessel to another until it is to be consumed. Keep the milk covered, using paper caps or an inverted tumbler on bottles, or storing it in covered utensils. Any household utensil that is to be used as a vessel for keeping milk should first be cleaned thoroughly and scalded.

Before opening a bottle of milk, wash and wipe the neck and outside of the cap with water and a clean cloth. The little depression on the top of the cap may collect dust or water and any milk that leaks out may attract flies. Lift out the cap with a pointed instrument so that the outside of the cap, which may be contaminated, will not be pushed down into the milk. Each time the milk is to be poured from the bottle it is a wise precaution to wash the neck as described.

Fertility of soil and a plentiful supply of pure water are the essential points to be considered in choosing a suitable location for hog raising. Given these, with an abundance of shade and the necessary preliminary training in swine husbandry, the man who cannot make money out of this industry may safely consider himself as out of the running when it comes to making money at anything. Soil, water, shade and energy tell the story in a few words.



Here's Evidence that COW ABORTION Can Be Driven Out of a Herd

It covers nearly twenty years and fully bears out Dr. Roberts' claim that you, at very small cost, can wipe out this profit-stealing disease *if you will do as Dr. Roberts tells you to do.* Read these letters carefully.

1898 "My herd of twenty-two cows was afflicted with Infectious Abortion in 1898. After losing a number of calves I began treating them with DR. ROBERTS' ANTI-ABORTION TREATMENT. I feel that they were permanently cured, for I have not lost any calves since that time, five years ago."—(J. A. Griswold, Duplainville, Wis.) "My herd of cows, eleven in number, was troubled with Infectious Abortion. I tried various remedies, without any relief; then I began treating my herd with ROBERTS' ANTI-ABORTION. I had ten live, strong, healthy calves come that year and have not lost a calf since that time—over three years ago."—(Sworn statement of Herman Shirley, deceased, Waukesha, Wis.)

What is lost on ONE good calf would pay for the complete treatment for an average herd.

1902 "My herd of twenty-two cows being afflicted with Abortion in 1902, I decided to try DR. ROBERTS' ANTI-ABORTION TREATMENT, which I did with results satisfactory, and I believe if used according to directions is a sure cure every time."—(I. Vandeburg, Kingston, Ill.)

1913-15 "In 1913 I applied your ANTI-ABORTION TREATMENT to my herd of forty-two head, and hereby wish to state that I cured my herd entirely and that I haven't had a single case of abortion since that time."—(Jos. F. Jira, Cary Sta., Ill.) "I am well pleased with your TREATMENT FOR ABORTION. I have nine fine calves and one cow left to calve yet. Two of the calves are from cows that aborted last year. I finished your treatment July 15, 1915, two months ago, and have seen no signs of disease since then."—(Iowa. Name on request.)

If your herd is afflicted with Contagious Abortion, and is free from tuberculosis, you can, with the Dr Roberts treatment, clean up your herd and wipe out abortion. All Abortion Treatments are shipped direct from our laboratories at Waukesha.

Economical Pumping

Can only be accomplished by the use of efficient pumping equipment.

Alpha Distillate Engine

AN EFFICIENT ENGINE is one that will not only continue to develop the full amount of power required on the smallest consumption of fuel, but will also require practically no attention during operation. It must be free from repair expense and the possibility of a breakdown during the pumping season.

ALPHA DISTILLATE ENGINES AND VIKING ROTARY PUMPS MAKE EFFICIENT, RELIABLE PUMPING PLANTS

All Alpha Engines are equipped with a high class, built-in, gear-driven magneto; they start on the magneto without cranking and the use of batteries and coils is entirely eliminated. Built in all sizes from 1½ to 100 H. P.

Viking Rotary Pumps

AN IDEAL IRRIGATION PUMP

Viking Pumps will deliver more water per minute for the same amount of power used than any other type. Its very high efficiency is due to its positive delivery, its correct design and careful manufacture. It is SELF PRIMING, requiring no foot valve or priming pump and is easy to install. Investigate the Viking Pump. Built in all capacities from 20 to 1600 gallons per minute.

Viking Rotary Pump

Send for complete catalog on both Alpha Engines and Viking Rotary Pumps. They are yours for the asking. Now is the time to consider pumping equipment.

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY

YOUR COWS MADE PROMPT. REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK.** It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. Price $1.00. Mailed postpaid, in plain wrapper.

Freight Tariffs on Pure Bred Stock

REGARDING freight tariffs on pure bred livestock Secretary Wayne Dinsmore of the National Society of Record Associations writes:

Breeders east of Chicago who have been compelled to pay on an arbitrary maximum weight when shipping animals in less than carload lots are requested to take cognizance of the fact that by the decision of the interstate commerce commission which went into force December 1, 1916, stallions can be shipped at a weight of 3000 pounds instead of 7000; ordinary horses at a weight of 2000 pounds instead of 5000; bulls at a weight of 2000 pounds instead of 5000; mare and colt or cow and calf at a weight of 2500 pounds instead of 5500. Other weights are scaled down in proportion and inasmuch as information has come to the National Society of Record Association that many agents are, in violation of law, still compelling shippers to ship at the old weights, all live stock breeders are urged to go direct to their agents and call their attention to the fact that the extremely high weights required in the shipment of breeding animals l. c. l. in the past no longer exist. They are further requested to ascertain whether the agents have received proper tariffs from their railroad companies.

The attention of all shippers in all parts of the United States is further called to the fact that animals may be shipped at their true values in the case of valuable breeding animals by the payment of a very slight increase in rate, to-wit: an increase of four per cent in rate for each 100 per cent increase in value of the animals over the basic values fixed in the tariffs, which are on file in each railroad station.

Any railroad company whose agent violates these rulings is subject to a fine of $5000 for each offense, and it may be wise to call the attention of local agents to this in cases where they seem negligent in informing themselves in regard to the new regulations.

Cheap Breeding Stock Expensive

By S. T. Simpson of the Missouri College of Agriculture

The unprecedented demand for pure bred live stock will sooner or later result in the marketing of many animals eligible to registry, which are inferior as individuals and which may prove poor breeders. The present high values afford all the better reason for investing in only good breeding animals even though they appear high in price. In this way only can the present high standard be maintained and the scrub pure-bred finally eliminated.

The use of the registered scrub can but discourage the cause of pure bred sires and better live stock. The breeder who markets such individuals will ultimately suffer the criticism of those who know good live stock, and finally be discriminated against in buying and selling. The purchaser of the scrub pure-bred can breed nothing but inferior individuals so long as he persists in buying the pedigree with no regard for individual merit.

The pure bred sire is the best means of live stock improvement. Whether good or bad he is half the herd and sometimes more. For this reason the selection of the sire demands equally as much attention as the entire group of females, and it is far more important to have a good sire, both in individuality and breeding, than to have one or two good females. If sacrifices must be made, let them occur in the selection of the females. Better still, let every one be a good one, both in breeding and individual excellence.

New Records and New Cattle

Official test work in the herd of registered Holsteins owned by Bridgford Company of Knightsen was well under way just at the close of 1916, and some very creditable short time records had been made. Bos Antonia Cornucopia at the age of two years and two months made 17.10 pounds butter in seven days, and for the same period Rilla Canary made 24.56 pounds, the junior four-year-old, Upland Zeffie Wayne made 25.78 pounds; Panje Hengerveld De Kol made 26.76 pounds; and the three-year-old Pauline Soldene De Kol 3d led the group with the splendid record of 27.78 pounds butter in seven days. She is a daughter of Sir Rag Apple Korndyke, whose dam is the 36.20-pound cow Sadie Vale Korndyke, daughter of Rag Apple Korndyke. The dam of Pauline Soldene De Kol 3d is Pauline Soldene De Kol, a 26.91-pound cow that has a 30.77-pound three-year-old daughter. Pauline Soldene De Kol 3d has a fine bull calf sired by King Veeman Pontiac Hengerveld, son of the $50,000 bull King Segis Pontiac Alcartra and a 29-pound daughter, with two 30-pound full sisters, of Sir Veeman Hengerveld. The first five dams of this calf average over 30 pounds butter in seven days, including two three-year-old records.

Bridgford Company has just brought out a carload of splendidly bred Holsteins from the East. Among the lot are two daughters of King Segis Pontiac Alcartra, one of them from a 31-pound dam, and the other from a 19-pound two-year-old daughter of a 37-pound cow. There are also three daughters of Spring Farm Pontiac Cornucopia, the $15,000 son of the 44-pound cow, K. P. Pontiac Lass. One of these heifers is from a 30-pound dam, one is from a 29-pound dam, and the third is from a 27-pound dam.

Then there are three daughters of Spring Farm King Pontiac, a son of King of the Pontiacs and out of a 37-pound dam. The dams of these three heifers have records of 31, 28 and 27 pounds.

Two good heifers are sired by King Pontiac Konigen, a 37-pound son of King of the Pontiacs.

The shipment also included six daughters of King Walter 5th, a son of King Walker and out of the 30.62-pound cow, Paula of Chagrin Falls 3d, who also made 751 pounds milk in seven days and 10,112 pounds in 100 days on official test. She was winner in the aged cow class at the last National Dairy Show. The dams of these six heifers all have good official records, one of them having over 30 pounds and two others above 29 pounds butter in seven days.

Some of the good record cows in the shipment are in calf to the $15,000 44-pound bull Spring Farm Pontiac Cornucopia.

102 "Indiana" Service Stations in the West!

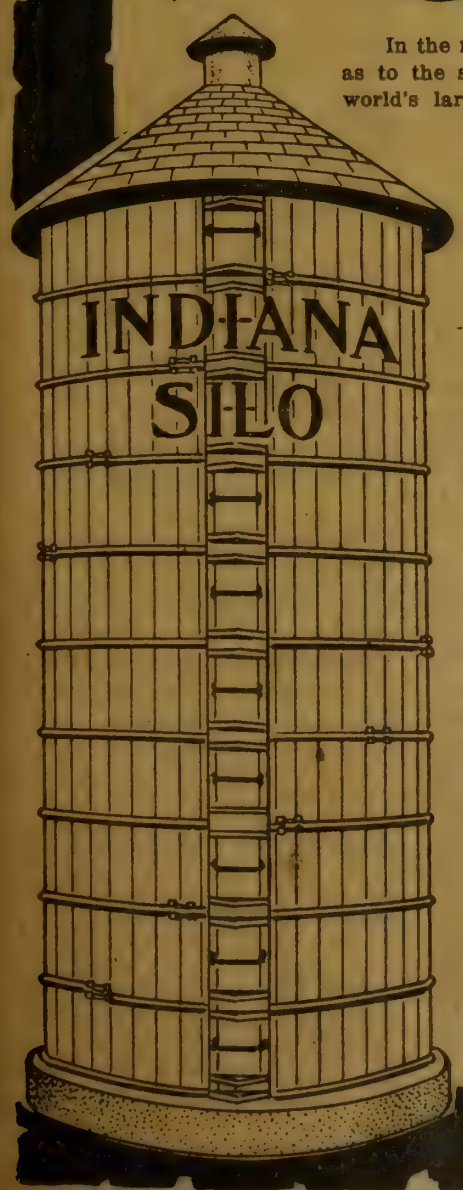
"Our duty to a customer does not end with our delivering to him a silo that is all we represented it to be; we must also assist him in learning to use it so as to get the best possible results."

Chas K Spaulding Pres.

THIS statement, from the man who outlines the policies of this company, explains why we strive so hard to make Indiana Silo Service equal Indiana Silo Quality! It also explains why Indiana Silo owners get such splendid results from the very first. They do not have to experiment.

Every silo representative we have in the field is a "service station," so to speak. Their mission is to give information and assistance, as well as to sell silos. Each man is also an "information-gathering" station, from which source we gather much of the experience, etc., set forth every month in our Silo Service Bulletin—"The Watch Tower of Prosperity." This data, carefully edited by our own agriculturist, will save thousands of dollars annually to users of the

INDIANA SILO



In the minds of thousands of men who read this, there is no doubt as to the superiority of Indiana Silo construction. Designed by the world's largest silo company, and tried out in actual use for over fourteen years, its clean, efficient record has been established on OVER 60,000 AMERICAN FARMS. Add to this our ABSOLUTE GUARANTEE, and we are sure you must realize your money is much safer invested in an Indiana Silo—known and sold in every state in the Union—than invested in any one of the unproven types to be found in every locality.

Indiana Silo prices have not advanced as yet, for we protected your interests as well as our by contracting for a number of cars of steel early last fall. Our business so far this year is breaking all records, and we may be forced to advance our prices, just as prices on your farm products have advanced. So our advice is—ORDER YOUR SILO EARLY!

Monthly Silo Bulletin FREE

Whether you have an Indiana Silo now or not—regardless of what silo you are interested in, we will be glad to send you this silo bulletin each month. We'll also mail our complete free Silo book. Fill out the coupon, or send a postal. Address all inquiries to our Salem office.

Don't Forget

The Dispersal of that Fine Herd of Holsteins at LAKESIDE

Thursday, March 15

Absolute dispersal without reserve or limit of the well known Lakeside Dairy Herd owned by Mr. H. I. Shaw. The herd consists of 22 head of registered Holstein females, 2 registered Holstein bulls, and 27 high grade Holstein cows and heifers.

Among the registered females are 7 daughters of a 32-pound sire; a daughter of Juliana King of Riverside, out of a 26-pound cow; two daughters of Arcady Pontiac Wayne Hengerveld; and five daughters of Captain Julip Zampa.

Two fine herd sires will be sold, both good individuals and richly bred.

Dairymen: Again we say be on hand at this sale if you want some real dairy cows.

Sale on the Thum Ranch, one half mile east of Lakeside, twenty miles east of San Diego.

Cow Testing in San Joaquin

THIS report of a year's testing in herds belonging to the San Joaquin County Farm Bureau Cow Testing Department is made by C. J. Williams, formerly assistant adviser in that county.

It is made up from herds belonging to the dairymen who have remained in the association for an entire year's test during the last year and a half of the association's existence. During this time there have been over 1000 individual cows tested but no satisfactory records could be obtained for a great many of them as they were not in the association lon· enough. This report covers practically the full lactation period of 636 cows belonging to 12 dairymen. Of this number 214 produced under 200 pounds butterfat; 147, 200 to 250; 154, 250 to 300; 71, 300 to 350; 38, 350 to 400; 12, 400 to 500; 1, over 600.

There was one cow that produced over 600 pounds of butter fat during a period of 12 months, and proved in a class by herself as no other cow came within 175 pounds of her mark. Of the 636 cows tested, 422 or 66.3 per cent of them paid a profit over the cost of their feed and care, and 214, or 33.7 per cent failed to pay for their keep.

In working out the cost of keeping a cow 200 pounds of butter fat at an average of 30 cents a pound, or $60, is taken as the cost of feeding a cow a year. The value of her calf and manure is used to cover the cost of her care and milking. Interest on the investment or her depreciation is not included in the $60, which is a very low figure for the cost of feed when it is figured at the market price.

The average lactation period of the 214 cows which produced less than 200 pounds of butter fat in a year was about eight months. The shortest lactation period taken was four months, and there were several boarders which milked the full 12 months. A great many of these boarders were sold after six months test, which was sufficient in all cases to detect them. Some of them are being held over for a second trial as they were taken sick during their period of test and did not have a fair chance or else they were heifers with their first lactation period and are being tried again.

The work of the association is a great success and will do great things for the dairies in this county. One of the main troubles is that it is being used only by the best dairymen, who need it the least. If 33 per cent of the cows in the best dairies in San Joaquin County proved to be boarders last year there is no wonder that there is a cry among the dairymen that there is no money in the dairy business. There should be 214 cows above the 600-pound mark instead of below the 200-pound mark. A 600-pound cow pays $120 above the cost of her feed, while a 200-pound cow is kept at a loss.

There is money in most any business if it is run on an efficient basis, and the dairy business is no exception. The keeping of books and the use of scales and the Babcock tester is as essential on a dairy as the use of scales and a bookkeeping sytem is in a grocery tore. Know what your product costs you to produce and you will know whether you are being cheated by your commission man or creamery or by your cows. A check on a full year's production of your individual cows is the only way to determine just what they are doing. The cow testing department of the farm bureau was formed to do this work on the most economical basis possible. If you are not a member you had better look over the above report and figure out if you can afford not to be.

WORMY HORSES DO NOT THRIVE

Many horses lose condition, or fail to make gains during winter months because they are infected with worms. This is especially true of colts. Horses suffering from worms generally have a good appetite, but apparently benefit little from the food eaten.

There may be no symptoms which point conclusively to worms, but this trouble is so common that if the colts and horses are not doing as well as they should for the feed given, a worm remedy may prove of decided value. In treating horses for worms, Dr. L. S. Backus of the University of Missouri College of Agriculture, suggests it is well to keep in mind that the drug is meant for the worm rather than the horse and should therefore be given in as concentrated form as possible. To insure this, little or no bulky food should be fed during the course of treatment, and as the parasites are stupefied by worm remedies rather than killed, the animal's bowels should be kept in an active condition so that the stupefied worms may be passed out before they regain their vitality. A well salted bran mash once a day will generally insure such an action.

The following formula is a worm remedy which is also of value as a tonic: Powdered nux vomica 2 ounces; powdered gentian root 4 ounces; powdered areca nut 6 ounces; sodium chloride 4 ounces; arsenious acid 2 drams. Mix. Give one heaping teaspoonful to every 250 pounds weight every morning and evening for about ten days. The medicine may be mixed with ground feed or sprinkled over oats or corn which has been dampened.

DEMAND FOR GOOD DAIRY COWS

The under supply of registered Guernsey females is a big handicap in the progress of the breed these days. There is a big demand for these most desirable dairy cattle all over the country from men and women who want to start herds of registered Guernseys, but it is not an easy matter to find a breeder who will part with any considerable number of females. There is a constantly increasing demand for registered Guernsey bulls from owners of grade dairies, and grade Guernsey cows are bringing excellent prices wherever any are sold.

Good grade Holstein cows were never in greater demand in California than right now. Never before have dairymen showed as much appreciation of quality as they do right now. The man who has consistently used registered Holstein bulls in his herd for years is now reaping the reward of his foresight.

Cooperation enables the growers to purchase supplies, such as machinery, spraying materials, barrels and boxes in quantities, thereby getting the lowest prices, and getting the advantage in car-lot freight rates.

NO DOSE TO MEASURE.
NO LIQUID TO SPILL.
NO STRING TO ROT.

BLACKLEGOIDS are small pills. Each pill is an accurate dose of blackleg vaccine.

BLACKLEGOIDS are easily administered—simply inject them under the skin with a vaccine injector.

TAKE NO CHANCES.

Don't wait until your calves become infected. This means certain loss—there is no *cure* for blackleg. Vaccinate now—before the deadly disease shows itself.

THE COST IS SMALL.

BLACKLEGOIDS are economical. The expense is trifling compared with the loss you are liable to sustain if you do not use them.

ORDER THROUGH YOUR VETERINARIAN OR DRUGGIST.

Write for free booklets on Blackleg, with full information about Blacklegoids.

Raise Your Calves on

Blatchford's Calf Meal

and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.

Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 5 Waukegan, Ill.

Careful attention given to mail orders.

Whittier State School

Whittier, Calif.

Purebred Registered

HOLSTEIN CATTLE

The highest prices ever paid in the St. Paul yards for a cow or a bull for beef were paid within a year for Holsteins. Two grade Holstein cows 13 years old brought $187, one 12-year-old registered Holstein cow $116, and a registered 4-year old Holstein bull $168.93. In considering Holstein cattle as a dual purpose breed, the above authentic facts render further comment unnecessary. There is big money in the big "Black and White" Holsteins.

RESULT OF STUNTING ANIMALS

Live stock products are the result of growth. The younger the animals the greater the growth impulse. Many factors influence the tendency of an animal to grow. Among these are age, condition, gestation, lactation, and the quantity and quality of food. A given amount of food will produce more growth on a young animal than on the same animal at a later age. All the growth factors influence the young animal much more powerfully than older animals. If an animal's food supply is insufficient for normal growth the animal may be retarded in growth. If this treatment is continued for a long time the animal may become permanently stunted.

Stunting an animal as the result of insufficient food may be only a temporary condition. An animal does not lose its capacity to grow as the result of stunting. F. B. Mumford, dean of the Missouri college of agriculture, cites a feeding test at the Missouri experiment station in which an animal that had been stunted by poor feeding to such an extent that it weighed only 200 pounds at 12 months of age, gained 841 pounds during the second year. Only 5.6 pounds of grain for each pound of gain made were required on this steer stunted during the first 12 months. A steer that had been generously fed during the first 12 months of life gained only 500 pounds during the second 12 months, and this gain was more expensive than the gain made on the stunted steer. The amount of grain required to make a pound of gain on the well fed steer was 9.8 pounds. It is certain that stunting an animal even for so long a period as 12 months does not destroy its capacity to grow.

CARE OF COW BEFORE CALVING

During the dry period the cow should be given a good ration so that she will be in good flesh when she freshens. This will improve the quality as well as the quantity of the milk. Just before freshening the grain ration should not be too heavy and should contain plenty of bran. The bowels should be kept well regulated. If necessary, one to one and one-half pounds of Epsom salts may be used as a drench. The cow should have a period of rest of four to six weeks in order to give the best supply of milk during the period of lactation.—O. C. Cunningham, Ohio College of Agriculture.

The hog's greatest enemy is lice. If there was any way of telling how much feed is used in supporting the lice on hogs it is probable that the economic loss would be greater than that occasioned by cholera. Any treatment to prove effective must include preventive measures as well as destructive remedies. Kerosene emulsion or crude oil are among the best known remedies. The kerosene emulsion can be prepared as follows: Hard soap one half pound, kerosene oil two gallons, soft water one gallon. Boil the water and soap until the latter is dissolved and after removing from the fire add the kerosene, either churning or stirring with a paddle until an emulsion is formed. When thoroughly mixed this emulsion should be as white as milk and of the consistency of cream and when cold will form a gelatinous mass. This will keep indefinitely and may be used at any time by diluting with warm water. The quantity of the mixture above given will dilute with 20 gallons of warm water.

A Rainy Day Job

Just because you can't work outdoors, the day need not be wasted. Use it for the job that keeps glanders, foot-and-mouth, anthrax and other fatal diseases out of your herd. It may be the most profitable day in the year. Disease, once started, may wipe out a lifetime's work.

CARBOLA The Disinfecting White Paint

is a snow-white mineral paint combined with a germicide 20 times stronger than carbolic acid. It paints and disinfects at one operation, cutting labor cost in half.

Use It Instead of Whitewash

to prevent disease and kill lice, mites, ticks, fly-eggs, etc. Comes in powder form. Put on with brush or sprayer as soon as mixed with cold water. Will not spoil by standing. Order some now and have it handy. Your dealer has it.

10 lbs. (10 gals.) $1 plus postage. 20 lbs. (20 gals.) $2 delivered.
50 lbs. (50 gals.) $4 delivered.

Trial package, enough to cover 250 sq. ft. and booklet, "The Disinfectant That Paints," 25 cents. If you cannot get Carbola locally, send your order and dealer's name to us. We'll ship promptly.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Pigs Coughing

What is the cause of pigs coughing? They have been weaned and are fed skimmed milk, alfalfa hay and pumpkins. It seems to bother most in winter time and they are very slow coming out of their stunted condition in the summer.—Subscriber, Turlock.

Coughing is one of the prominent symptoms of cholera. If they have not been vaccinated you had better have it done. Write State Veterinarian, Sacramento, and he will advise you about the vaccinating. Your pigs should have a clean, dry and warm place to sleep during the cold, wet months or they may contract colds that would set them back very much.

Feed For Sow

How should a sow be fed that is carrying pigs?—Subscriber, Turlock.

Sows with pig should be fed plenty of sloppy feed. There is nothing better than skimmed milk. Some grain and plenty of bran in it will help to give the pigs a good constitution to start with. The alfalfa is good also. You seem to have the proper feed. See that the sow gets plenty of exercise.

Barley Beards or Sharp Teeth

I have two horses that slobber or have a sticky, stringy saliva continually dripping from their mouths. They are fed on barley and oat hay. What is the cause and what is the remedy? —Subscriber, Clovis.

It may be due to sharp teeth or barley beards lodged under the tongue or about the gums. Get a veterinarian to fix the teeth, and he will probably also find some barley beards sticking around somewhere in the mouth. Sometimes the beards work through the tongue and come out through the skin below. That makes a very hard abscess to heal.

Sweeny

What is the treatment for sweeney? —Subscriber, Clovis.

We have answered the question for treatment of sweeny several times; the last in the Cultivator of January 27 on page 107. Can not do better than to refer you to that.

Cow Drops Food from Mouth

I would like to know what to do for a cow that drops her food after chewing it, not all the time, but is getting worse and will eat but very little dry food. Consequently is getting very poor. Can not get her with calf. Please answer soon.—Subscriber, Wildomar.

Probably the trouble is all in the mouth. She may have a loose tooth or it may be that some barley beards have found a lodging place in the tongue or about the gums. If you are not able to examine the mouth yourself get a veterinarian to do it and he will probably regulate the trouble very quickly.

Mange

Have a mare that is bothered with mange. It is mostly on her mane and tail. Have used sheep dip and sulphur on it but it only relieves her temporarily.—Subscriber, Mecca.

Try mixing the sheep dip with ten times as much heavy engine oil and rub it in well. Repeat every few days for a month.

LIVE STOCK SALES

California Breeders Sales & Pedigree Co., Holstein cows, heifers and herd bulls, Lakeside, San Diego County, Thursday, March 15.

California Breeders' Sales and Pedigree Company, Dispersal sale, Modesto, April 19, 1917.

Lake Mills Holstein Breeders' Consignment Sale Co., Lake Mills, Wisconsin, April 6, 7, 1917.

California Breeders Sales and Pedigree Co.—20 registered Holstein bulls, Chico, May 24, 1917.

California Breeders Sales and Pedigree Co.—180 registered Holsteins, University Farm, Davis, first week in June. Date to be announced later.

Ground has just been broken at Galt for the erection of a $200,000 milk condensary, with a capacity of 100,000 pounds of milk daily. It is reported that about 5000 cows have been signed up. The Utah Milk Condensary is the owner of the new plant.

FIELD NOTES

The N. H. Locke Company reports recent sales: To A. J. and Nellie A. Morse five heifers carrying the blood of King's Valet, Grace's Fox and Gertie's Son and a young son of King's Valet and Sara Joaquin's Lottie, a cow of great capacity and large production, a foundation herd. To R. R. Smith six young Jersey cows of good production, carrying the lines of the N. H. Locke Company producing sires. To E. C. Rand of Brae Bourne Ranch King's Gordon Fox of L, a great grandson of King's Valet, Empress Lass and Champion Flying Fox.

J. N. Hagler, Visalia, recently purchased from McAlister & Sons, Chino, the splendid young bull, King Korndyke Sadie Vale 23rd. He is 22 months old and as his name indicates is a son of the sensational King Korndyke Sadie Vale, whose first nine daughters to freshen have averaged over 25 pounds butter in seven days. Four of these heifers as three-year-olds made 31, 32, 33 and 34 pounds butter in seven days. The son Mr. Hagler bought is rich in the blood of high testing and high producing lines. His dam, Elzeveer Barnum De Kol 2nd, is a 19-pound two-year-old daughter of Sir Sadie Cornucopia, the sire of the former California state record Baldwin cow, Alba Sadie Cornucopia Creetia, 34.13 pounds butter in seven days, and a son of the first 30 pound cow of the breed. Mr. Hagler has a number of high class females in his herd and is constantly improving.

F. A. Doerfler of the Mellow Lawn Farms of Oregon writes that official test of his Jerseys shows an average for the month of January of 58 pounds, every cow in the herd excepting one two-year-old making above 50 pounds of butterfat. The cows were fed, milked and cared for by Twinkle Starr, the same herdsman who showed and fitted the C. P. Hembree herd which showed at the California state fair in 1914.

BLACK AND WHITE CALENDAR

E. J. Weldon and Fred W. Kiesel breeders of the Blacks and Whites at Sacramento, have issued a most attractive calendar, which carries illustrations of King Korndyke Sadie Vale Ezeveer and Prince Gelsche Walker Korndyke heads of great dairy herds.

PEACH GROWERS DECLARE PRINCIPLES

RESOLUTIONS apopted by the board of directors of the California Peach Growers, Inc., at Fresno, February 19, 1917.

Whereas it has come to the attention of the trustees and directors of the California Peach Growers, Incorporated, that criticisms and strictures on this association, emanating from a very high authority, to wit: State Senator Brown of Los Angeles, have had wide publicity, and

Whereas, we know that the organizers of this association were actuated by a sincere desire for the public good as well as for the protection of a very useful industry which was threatened with extermination, we deem it our duty to put ourselves on record, in answer to Senator Brown's criticism, as follows:

Senator Brown objects to the California market director directing his activities to the formation of growers' cooperative associations, assuming that these associations are organized wholly for the benefit of the producer with the inevitable result of raising the prices of commodities to the consumer. Were this entirely true it might be argued that inasmuch as nine-tenths of the products referred to are consumed outside of the state of California it would be profitable from a California standpoint to pay a salary of $5000 a year, for the purpose of securing many millions in increased prices of our commodities, sold outside of the state. But as a matter of fact with the raisin and peach associations while the producers' prices were increased it is also true that the consumers' costs were not made higher. The only parties injured were speculating middlemen who operated to depress the price to the producer and enhance it to the consumer. The records in regard to raisins, dried peaches and other commodities incontestably prove that with an average increase of from 33 1-3 per cent to 50 per cent to the producer the consumer actually gets the goods at as low, if not a lower, price than formerly.

Senator Brown speaks of these cooperative selling companies as interfering with the free operation of the laws of supply and demand. As a matter of fact we know that the laws of supply and demand in California products, as well as in the marketing of most commodities, have not been in free and unhampered operation for several decades. In the matter of marketing peaches, with which particular subject this company is most familiar, the laws of supply and demand were not in free operation prior to the time of our organization. On the contrary, a combination of buyers, who control the only channels by which the commodities could reach the market in large quantities artificially depressed by various methods the buying from the producer to such an extent that thousands of acres of very valuable peach orchards were being rooted up and destroyed or abandoned to the incalculable loss of the industry and the state. The organization of the California Peach Growers, Inc., simply gives the grower a selling combination with which to deal with the buying combination so that as far as the laws of supply and demand are concerned they are rather restored and made operative by the organization of this company, than otherwise.

Nearly all commodities are controlled as to price by some combination at some point along the line from the producer to the retailer, and in this age of combinations (labor, capitalistic and trade) the laws of supply and demand are only so far operative as that when the trust advances the price to a prohibitive figure purchasing ceases. But in any other respect than this (that the buyer will not pay more than the traffic will bear) the laws of supply and demand have long since ceased to operate. If manufacturers, financiers, transportation companies, working men and all other factors in the industrial world combine, it is time that the agricultural producers of the country should combine too, so that while paying combination prices for everything they consume they will be able to get reasonable prices for commodities they produce.

Society cannot return to the era of unrestricted competition without foregoing the advantages that steam, electricity and organization have conferred upon it, so that the demand should be rather that each organization should be able to vindicate its own right to existence and the righteousness of its course rather than to attempt the impossible in denying organization entirely.

That the California Peach Growers, Inc., are justified in organizing we confidently affirm, and for proof of our affirmation we appeal to the record which shows that for three years previous to the existence of the company the prices for peaches were so low as to be entirely unremunerative, with the result that the industry was being ruined, while at the same time the retail prices in the large cities of the East for peaches were so high as to place the fruit beyond the reach of the poorer or even the middle class people. On the other hand the record of one year of the existence of the company shows that the farmers have received a price sufficient to encourage them to continue in the business while the average price to the consumer is no higher than formerly. With this record we believe that the organizers of the company are amply vindicated, and Senator Brown will find enlightenment and instruction in the study of the record and experiences of California farmers' cooperative selling companies.

PIPE

New and Second-hand Water Pipe and Casing

CASING AS FOLLOWS:

600 ft. 11⅝ inch Casing.

We manufacture Levelers for any power

A Schmeiser Leveler of the "Giant" Type

will work wonders on your form

MOVING immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, ***Schmeiser Power Land Levelers*** are now being used with utmost success by a great many ranchers, large and small,—also by contractors—saving their owners time, labor and money.

So extremely simple a child could operate one, as a simple twist of the wrist raises and lowers the bucket, or holds it stationary, as the case may require.

Letters to a Beginner

Written for California Cultivator By Jean A. Koethen

THE POULTRYMAN'S FIGHT

DEAR George:—You are finding out by this time that there is more to the poultry business than just raising chickens. The successful poultryman must be a thorough-going farmer. He must also be a scientist and versed in the art of salesmanship. This, one would think, is enough for any one man, but it is only the beginning. The poultryman of your generation has before him the task of elevating the great poultry industry, a billion-dollar industry it is now, to its rightful place among the other industries of the world.

A few years ago there was no such thing as a poultry industry. Folks kept chickens, good or bad made no difference. In 25 years this keeping chickens has grown to be one of our great national industries, but it has grown so fast that it has no standing. The poultryman, because he has never insisted on a margin of profit that would enable him to properly take care of overhead and other expenses, is expected to sell his produce at a loss when the dear public demands it. The public, because it is accustomed to buying eggs in the spring for 25 cents or less, refuses to pay more, and the poultryman, because his product is perishable and cannot conveniently be kept, lets it go for what it will bring regardless of the cost of production.

I bought some baby chicks the other day and paid for them exactly what I paid for the first chicks I ever bought. The price of feed is nearly double what it was then. Kerosene has gone up. Feeding and hatching cost considerably more than they ever have before, but the price of chicks has not changed, neither has the price of eggs nor that of table poultry.

Organization is the solution of the problem. Poultrymen must stand together and refuse to sell their product for what it costs to produce it. If they do not stand together this refusal will be absolutely ineffective. And standing together costs something.

It is the same problem that confronted the orange growers 25 years ago. They had to organize to bring the middlemen to terms, but there were always some who wouldn't organize. When better prices could be had by staying out of the organization they stayed out. That better prices were finally wrested from an unwilling public is due, not to the men who stayed out to put a few more dollars in their own pockets, but to those who stayed in right along, year after year, and sacrificed some of their profits for the sake of the cause.

The poultry industry is going to be a bigger industry some day than orange growing. Maybe it is already. Folks can do without oranges, but they have to have eggs. Why, the egg is the most perfect of all foods. Children must have eggs. Invalids must have eggs. Cooks and bakers must have eggs. A smart college student ate two dozen, to win a wager the other day. The 24 eggs would have made him 24 sufficient meals with the addition of a little bread and lettuce. There's everything you need in an egg, and the dear public knows it. It is an absolute necessity, and the poultryman is bound to win out if only he stands firm.

"The fight is on," said Association Secretary Smith the other night at the meeting of the Scrub Hollow Poultrymen, "and it will be on as long as the association lasts." The middlemen are doing all they can to kill it, but we've got to win." It just made a thrill go down my spine to hear him say that. Fighting is awful when it's just for the fun of fighting, but fighting for a just cause is glorious.

I've been through every stage of the poultry fever. First the enthusiasm and exhilaration at the thought of all the money there was to be made by keeping hens and letting them lay eggs "for gentlemen". Then the period of depression when I concluded there was nothing in it, and never would be. Then gradually, a dawning conception of the greatness of the poultry industry. Not a business in which great fortunes are amassed without effort, but an industry which, at the cost of great effort, often in the face of tremendous discouragements, provides the world with something the world must have and which it will sooner or later be willing to pay for. It is for this industry poultrymen are fighting, George, that it may be put on a firm foundation and be known, not as "the chicken business" a business any down-and-outer may turn to as a last resort, but as an industry for which only the best trained men are fit.

I don't think I need suggest that you get into this fight, George. Any man that believes in good poultry will want to get into it,—that is, he will if he has red blood in his veins. I'm not counting those thin-blooded folks who are afraid to move for fear they'll get hurt.

Affectionately,

Aunt Jenny

The Truth About Poultry

MR. W. H. Macy, one of our subscribers, makes reference to an article written by Francis F. Lincoln, which appeared in the Rural New Yorker some months ago. It is a common sense business man's view of the poultry business. It contains some warnings and suggestions which make it well worth repeating. Here it is:

A Changing Business

The poultry business has a more shifting personnel than any other I know of. People are constantly starting, and after a few years many of them are stopping. They may have but a dozen hens, they may have a hundred or they really make it their business and have several hundred or thousands; the establishments vary from a mother hen on a dozen eggs in a little A coop to a large-scale plant complete, costing several thousand dollars. Almost all expect to find big profits. Generally there comes a grand awakening, and many give it up.

Claims and Realities

The causes for this state of affairs are several. It is a peculiar thing that a few hens will do very much better than a large flock. People do not fully realize this for many reasons; at poul-

try shows hen fever runs high, and many malignant cases of "chickenpox" are contracted. In their conversation and in their advertising some breeders make all sorts of extravagant claims for their birds. Equipment makers reinforce these claims with unnumbered testimonials telling of 85-95 per cent hatches, rearing with practically no loss, and flock after flock averaging from 175 eggs per hen up. These letters may be geunine, but they are misleading and mischievous in that they lead people to expect far more than they are likely to receive—yields of 175 eggs are doubtless possible, but, with a sizable flock, highly improbable. Beginners may not expect to get 180 eggs per hen per year, but after reading a few dozen letters they are likely to think that if these people can get those yields they surely can get 160 or so. Just realize that in the Connecticut egg-laying contests the average has been around 150, and the 1000 birds there do not represent the run of flocks, but the very cream of many flocks. I do not think that the average output on a great many of the plants where egg production is the central feature reaches 120 eggs per hen per year.

Sales of Surplus Stock

Furthermore, many beginners expect to dispose of any surplus stock at the same price that they paid for their foundation stock. A moment's thought will show that this is not to be. The demand for stock is limited and will naturally go to those who have been working over their hens for years. In fact anything over their value as food that breeding stock commands is paid in recognition of the work and pains behind the stock. New men are constantly entering the ranks of the established breeders, but beginners cannot expect to be considered as such or receive more than market prices for their products. Let us see what a person of some slight experience making his first start with poultry on a considerable scale may expect.

Hatching

If he keeps Leghorns he will do most of his hatching after the cold weather, and is likely to average 60 per cent of the total eggs set; he may average 66 per cent. With heavy breeds the average will be lower. Hatching should be done earlier; fertility is then lower and many fertile eggs do not hatch; 50 per cent is not bad at all for a season's average, and often it will be below this.

Rearing

This varies greatly with different men and with different flocks with the same man. A beginner should not count on rearing more than 50-60 per cent. He may do better, but if the brooder burns up, if the lamp or coal fire goes out, if an unexpected hail or thunderstorm catches young stock outside, if rats, cats, hawks, foxes, etc., are troublesome—and all such things happen—the results may be very disappointing.

Culling

Throughout the summer, or, if it has not been done before, when the pullets are put into the laying houses, they should be looked over carefully. Probably ten per cent of most flocks could be profitably buried on October 1; robber hens are as bad as robber crows, and a bird that is backward about growing is likely to be backward about laying. As dangerous as mathematical calculations are when introduced into the poultry business it may be well to summarize probable results roughly: 1000 eggs set; 600 chicks hatched; 330 chicks reared; pullets 50 per cent; 150 pullets after culling about ten per cent. These figures can be beaten, but they represent about what a person with some, but not a great deal, of experience can expect; it is easy to come out much worse.

Profits Per Hen

These vary, beginning quite a bit below zero. It should be remembered that most of the very profitable flocks draw income from some other source than the egg and poultry market. I was talking recently about what might be expected per hen per year, with an incubator expert who travels constantly, visiting plant after plant everywhere, and who stays long enough in a place to find out about things. He said, "They talk about two dollars, five dollars and seven dollar hens; well, perhaps, but I think that most men make between 90 cents and a dollar." This can give a man who has kept a few hens a fair idea of what he can expect if he decides to make egg production his business. He can obtain the above by steady, careful work, and, after a few years' experience has taught him some things he can learn in no other way, he can expect to do a little better. Few there are who will ever get rich on producing market eggs, but for a man who likes to work, is willing to think, and likes hens, there is an opportunity to make a living out in the open where there is real air to breathe and all nature to look upon."

Judging Productivity

Without question one may form fairly close estimate of the productivity of a hen from the color of the comb, from the general look of health and the activity of the bird and from conformation and other factors form something of an opinion as to the ability of a hen to produce eggs. How much of worth there is in any one system is not so certain. However, we wish information on any topic which will aid the poultryman in selecting the best of producing stock. On this point we have from Mr. W. H. Macy of Macy's Poultry Farm, Glenn County:

Many up this way have been led to believe in the "Hogan" system of culling and judging their flocks. Some claim the system has been proved to be true by the results obtained by the continued use of the trap nest. Not long ago I saw the statement that the Washington state contest birds were all examined by Mr. Hogan this year and their future egg record predicted. If this is true can you not get at the facts and let us all know them. My brother and I have trapnested a few birds the past two years, five one year and 35 last year, and it is a big job, but possibly worth while for what we learned by it. Our experience has not tallied with this Hogan system. One of our very best hens scores low by his method and one of the poorest producers scores high. In judging a hen for productivity the one word activity comes nearest telling the story of any short definition we have come to know.

It is planned to hold a meeting of the California State Poultry Breeders' Association at the university farm during the short course, May 28, 29, 30, 1917. This will enable several hundred breeders to get thoroughly acquainted with the work of the poultry division.

The Pride of Petaluma Fresh Air Brooder Stove

Well, here we are again, and our No. 20 catalogue is now ready for you. It's a HUMDINGER, and if you are interested in poultry you should have it. It's full of splendid information about brooding in bunches from 300 chicks on up with the brooder stove system. If you are satisfied with your present brooding system, get our catalogue and learn how you can BEAT IT. If not satisfied, GET OUR CATALOGUE No. 20, it will put you RIGHT. We also have a splendid HOT WATER SYSTEM, but we can't tell it here, so Get our CATALOGUE No. 20. IT'S FREE FOR ASKING.

TREES

Fruit Trees That Produce—You can't get good big crops of good fruit from poor trees. Elmer Bros.' trees produce because they are clean and healthy; strongly rooted; budded from trees of proven productiveness and are properly handled from the time they are put into the ground until they are dug and delivered to you. We grow everything worth while in the fruit line. It will pay you to communicate with us at once as this is the cheapest place to buy good trees. Write for free catalogue and prices. Elmer Bros.' Nursery, "The Nursery that Helped to Make Santa Clara Valley Famous", 82 S. Market St., San Jose, Cal.

For Sale — Washington and Thomson Navels, Valencias, Seedless Grapefruit, Eureka, Lisbon, Villa Franca and Seedless Lemon, Harman Avocados. Buds were selected from the best bearing trees and will yield bumper crops. Also 40,000 Mission and Manzanillo Olives. The above stock is growing in Rialto, Whittier, Glendora and Fallbrook. Budding cloth 30c yard, post paid. No frost damage. We solicit your patronage. Prompt replies to inquiries. Cyrus W. Wilhite, P. O. Box 154, Glendora, Cal. Phone 303.

For Sale—Placentia Perfection budded walnuts on Northern California roots or Japanese blight resistant roots. Apples, peaches, plums, etc.; all true to variety. We have Roeding's new Gower Nectarines. Earliest and best of all. Prices on application. Los Nietos Valley Nursery, Downey, Cal. Phone 692.

By far the lowest priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator. The cost is only 8 cents per word per issue, with a minimum of 35 cents.

Olive Trees—Three years old this spring. Stock taken from a record-bearing grove. 2000 MISSIONS, 4000 MANZANILLOS; absolutely no finer nursery stock to be had in California. A portion of stock located near Redlands, the balance near Porterville. Price reasonable, mailed on request. J. A. Burke, 612 Black Building, Los Angeles, Cal.

250,000 Home Grown Fruit Trees—Apples, pears, plums, peaches, apricots, figs, ornamentals, etc.; finest ever grown. Investigate the low prices of our first class stock before ordering elsewhere and save money. Inspection of nurseries invited. Orange County Nursery & Land Co., P. O. Box 285, Anaheim, Cal.

Eureka Lemons—Healthy, nearly 5000 two years old. Buds from known heavy bearers of fancy fruit. Trees grown between young orchard and must be sold this year. Information cheerfully given. E. J. Vander Sluis, Glendora, Cal.

Citrus Trees—All leading varieties. Large line, Lisbon & Villa Franca Lemon and Washington Navel trees. All first class and clean. Special prices to dealers or in carload lots to growers. Randall Bros.' Nurseries Co., Whittier, Cal.

For Sale "Lane's Wonder" Tangerine. My own propagation. A delicious fruit. Will send sample of fruit by request. 1-year-old buds $2.00 each, ready for June setting. Harmon Avocados $1.00 and $2.00. A. Z. Lane, Glendora, Cal.

6500 Washington Navels, 7000 Late Valencia Orange trees ¾ up to two years old. Buds carefully selected. Stock thrifty. 30c each open roots, 38c balled f.o.b. Glendora. Wilbur K. Howard, Box 464.

Broad Leafed Mission and an extra early strain of Manzanillos. If you want the early ripening and early bearing kinds, we have them. Every tree guaranteed. Olives exclusively. H. Detmers & Son, Exeter, Cal.

TURKEYS

GIANT BRONZE TURKEYS

Let me tell you how to make more money on turkeys. Large turkeys can be raised at practically the same cost as small ones. It is in the strain. By scientific cross-breeding I have developed a strain of turkeys which mature rapidly, and attain unusually large size by holiday time. You can introduce some of this blood into your flock and make money by it the very first year. Gold Nugget strain wins again! At Pacific Coast largest shows, 1916, the California and Arizona State Fairs and San Diego, also the great Los Angeles Show 1917, eleven prizes eleven entries. Stock and eggs from my flock should put you in the Giant Bronze Turkey lead in your locality. Toms for sale, also eggs. Write for circular. Raised on 320-acre farm. Address J. Will Blackman, 607 East Third St., Los Angeles, Cal.

Cory's Mammoth Thornless Blackberries. Orders are being booked now for February delivery. Prices and other information upon application. Ekstein Nursery Co., Sole Distributors, Modesto, Cal.

Roses 50 cents per dozen. Apple trees $6.00 per 100, Olives $4.00 per 100. Big stock fruit and ornamental trees and roses. Write for catalogue. Kavan Nurseries, San Bernardino, Cal.

Florida Sour and California sweet seedling orange seed from cultivated Florida and California groves. Order early. Milo Hunt, Whittier, Cal.

Mr. Alfalfa Grower—Permit me to send you samples and prices of alfalfa seed; common and Peruvian. Best seed at lowest prices. O. C. Nordahl, Bard, Cal.

The "Himalaya", best blackberry; enormous bearer. Splendid shipper. Strong plants 50c dozen, postpaid, $20.00 per 1000. Louis Bahrs, Loomis, Cal.

Alfalfa Seed—The very best, guaranteed 16c. Wm. Stuthman, 1239 West Pico St., Los Angeles, Cal.

Nurserymen—Pot grown conifers, palms, shrubs and ferns for lining out or potting. Ballou's Nursery, Pasadena, Cal.

Wagner's Giant Crimson rhubarb roots, $2.00 per 100, 5c each, small lots. Curtler Bulb Co., Seabright, Cal.

Strawberry Plants—Everbearing. Northern grown, strongly rooted. Price list free. F. I. Moffet, Ellensburg, Wash.

For Sale—Ettersburg Strawberry plants $2.25 per 1000; guaranteed to reach you in good shape. Parker Bros., Hemet, Cal.

MONEY TO LOAN

Money on Hand at all times, for good loans, on Improved Farms, Land, City Property, Business Blocks, Bungalows, to pay off mortgages, or for building loans. I deal with the largest mortgage companies in the United States, who have loans from San Diego to Seattle, and as far east as New York, also with the best companies on the Pacific Coast. Inventions financed. Send full information and legal description. C. G. Paul, 407 Chamber of Commerce Bldg., Los Angeles, Cal.

IRRIGATION ENGINEERS

Contour Tree Staking, pumping plants, pipe lines, flood control and conservation. Bennett & Duling, Engineers, 1125 Central Bldg., Los Angeles, Cal.

EXPERIMENTING WITH AUSTRALIAN WHEAT

The Sperry Flour Company has just finished unloading Australian wheat at their mills in Stockton. It has been many years since a cargo of Australian wheat has been brought to California. In apperance it is much like the wheat formerly imported for seed purposes. Some of this seed will be sown on the Sperry experimental ranch at Farmington, which is a few miles out of Stockton. If it is found that the grain does well in California soil and retains its original properties, t is confidently expected that many farmers will put in a crop next fall.

The Lake Mills Holstein Breeders' Commission Sales Company has changed the date of its sale which was to have been held in Lake Mills, Wisconsin, May 1 and 2 to nearly a month in advance, or to be exact, to April 6 and 7, same place.

Household Department

THE MYSTERY

"Tain't me," said the farmer,
Who's getting the stuff.
"Tain't me," said the packer.
I get just enough
To pay a small profit,
As far as can be.
And all of them chorus
Together, "Tain't me."
"Tain't me," says the tanner,
Who gets the high price
For high shoes and low ones,
For slippers and ties.
"Tain't me," says the rancher,
I live and that's all.
"Tain't me," says the dealer,
My profits are small.
"Tain't me," says the canner,
My margin's the same.
"Tain't me," says the huckster,
Who's bracing the game.
"Tain't me," says the gardener,
I'm poor all the time.
"Tain't me," says the grocer,
I ain't seen a dime.
It's surely a puzzle
To know where it goes;
No maker or seller
Or any of those
Partake of high prices,
So they all agree;
And I'm a consumer,
I'm certain "Tain't me."
—J. W. Foley in N. Y. Times.

MY GARDEN

Written for California Cultivator
By "The Lady of the Garden"

WHEN I heard the call to talk about our gardens I felt that for once I must speak up in meeting, for my garden is my very nearest and dearest hobby. To be sure my experience is very limited but I do not know anyone who gets more fun out of growing things than I do, and if I can pass on a wee bit of my enthusiasm to some other woman I shall have justified my right to a word.

Our professors used to tell us that there was nothing like the joy of self-expression and nothing so necessary for growth. Now I know few more satisfactory forms of expressing oneself than in growing rows of crisp green lettuce or tomato plants laden with their crimson burden.

My council to every woman is to have a garden if it is only a box in the kitchen window. It will mean pleasure and health to your family throughout all the spring and summer, and to you the joy of accomplishment than which there is none greater.

My garden plot is about one-eighth of an acre of sandy land, irrigated from a reservoir. The main irrigating ditch runs the long way of the garden, and from it smaller ditches (depth according to the size of plants) are dug between the rows of vegetables. Last year I took all the care of my garden except the initial plowing and the applying of a heavy dressing of rotted manure, placed on ground in fall and plowed under in January.

I raised in a very simple cold frame, with a light canvas for cover, my tomato and lettuce plants. This season I intend extending my cold frame space to take in sweet potato, cabbage and pepper plants. It is so much more satisfactory to have your own plants, then you can transplant them immediately before they have time to wilt.

Before planting my seed in the garden plot I made my ground as fine as silt with hoe and rake and kept it this way by cultivation after each weekly irrigation.

From my little garden spot I furnished my family of five with delicious radishes, onions and lettuce throughout the spring months. I have not yet learned the secret of carrying these into the summer with success. Later we had carrots, turnips and beets in season, also an abundance of "stringless" string beans and cucumbers. From four dozen tomato plants we had all the most delicious tomatoes we could use, besides selling several dollars worth and giving away a good many. I put out 100 sweet potato plants, saved 90 and harvested over 200 pounds of fine large potatoes.

Here in Antelope Valley we have to shift the season for planting laid down for us by the Cultivator experts, as our spring is much later than nearer Los Angeles; but aside from that I find their advice most helpful. Before I became interested in gardening such articles had scant attraction for me, but now they and the new seed catalogues are more thrilling than the latest fiction.

Blessed be the good natured, for they bless everyone around them.

DELCO-LIGHT

For the first time electric light and power are available to anyone—anywhere.

Heretofore, the benefits of electricity have been confined to those who live in the larger towns and cities.

Now Delco-Light makes electric current universally available.

Delco-Light is today furnishing thousands of farm-houses with brilliant, convenient, safe and economical light.

It is furnishing power to operate pumps, washing machines, churns, cream separators, milking machines, vacuum cleaners, etc.

It is lighting country churches, stores and public halls.

It is furnishing light and power to summer homes and camps, to houseboats and yachts, etc.

It is lighting rural railway stations and construction camps.

It is lighting the camps of United States troops on the Mexican border, and it is disclosing heretofore undreamed-of beauties in the depths of Mammoth Cave, Kentucky.

Altogether, over 15,000 Delco-Light plants are in operation, and Delco-Light offices and service stations are to be found in almost every part of the world.

Delco-Light is a complete electric plant—the engine and dynamo in one compact unit, combined with a set of specially built and wonderfully efficient batteries for the storing of current. The plant is so simple a child can care for it, and so economical that it actually pays for itself in time and labor saved. It operates on either kerosene, gasoline or natural gas.

MT. GEORGE FARM CENTER

Written for California Cultivator
By M. E. Beresford

DIRECTLY to the east of the city of Napa lies a very enterprising community which for the last two years has been united as members of the Mt. George farm center in the Napa County farm bureau. The officers of this club have held their positions ever since its organization and through their strict and unselfish devotion to duty deserve a large share of the credit for its fine achievements. They are Mr. G. W. Elicker, director, and Mrs. J. W. Dumbrell, secretary-treasurer.

During the short time that has elapsed since its founding the center has accomplished many things that make for direct community benefit and social improvement. In July, 1915, they erected blue and white enamelled road signs in the neighborhood, paying for these by a very successful old-fashioned box social. Their banner achievement was the building of the first farm center hall in the state. Plans for this were first discussed at a meeting held in January, 1916. A site was purchased on the Hagen road and on February 13 ground was broken. September 3 the hall was dedicated with impressive ceremonies. The work was all donated with the exception of a small amount of skilled labor from outside the center membership. The ladies of the center furnished excellent meals during these work days and people came from far and wide to assist.

CELEBRATE ORANGE DAY MARCH 10

March 10 has been named Orange Day, when every loyal Californian should eat at least one orange. Here are a few ways for the cook to tempt her family:

Orange Shortcake

Sift two level cups flour, four level teaspoons baking powder and one half teaspoon salt twice. Mix in lard the size of a small egg, then moisten with milk to form a soft dough. Roll into two sheets to fit pans of same size and bake until nicely browned. Take from oven and spread while warm with butter. Have ready some thinly sliced oranges, put between layers and on top and sprinkle thickly with powdered sugar. Serve slightly warm.

Marmalade Sandwiches

Cut thin slices of bread and toast, then butter and spread with orange marmalade. Tiny baking powder biscuits may be used in place of the toast for variety.

Orange Bread

One cup scalded milk, three tablespoons molasses; one teaspoon salt, one yeast cake, one-third cup lukewarm water, one and a half cups bread flour, one and a half cups Graham flour, half cup candied orange peel, half cup nut meats.

Mix milk, molasses and salt; when lukewarm add yeast cake dissolved in lukewarm water, and flour; then add orange peel and nuts, cut in small pieces. When thoroughly mixed, let rise until double its bulk; cut down and fill small buttered moulds one-third full; let rise to double its bulk, and bake in a moderate oven.

Orange Sweet Pickle

Four oranges, two cups sugar, one and a third cups vinegar, one teaspoon cloves, one teaspoon stick cinnamon.

Peel oranges, removing white membrane; cut into thick slices; steam

The Cultivator Patterns

8185—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. Long or short sleeves may be used.

7823—Girls' Dress. Cut in sizes 6 14 years. The dress has a plain guimpe and a two-gored plaited skirt.

8031—Ladies' Dress. Cut in sizes 36 to 42 inches bust measure. This dress is cut in one piece.

7660—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. Fine lawn, China silk, madras or crepe de Chine can be used for this pretty waist.

8224—Boys' Russian Suit. Cut in sizes 2, 4 and 6 years. The blouse slips on over the head, has a shield and separate pair of knickerbockers.

7577—Ladies' Apron. Cut in sizes 34 to 44 inches bust measure. Linen, gingham or calico can be used for this apron.

8186—Ladies' Skirt. Cut in sizes 24 to 32 inches waist measure. The skirt is cut in three gores and has a slightly raised waist line.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

Pattern Department

California Cultivator

Los Angeles

until tender. Boil sugar, vinegar and spices, tied in cloth, for 25 minutes. Add fruit and simmer slowly for one hour. Let stand a week or two before using.

Orange Cream Candy

Two cups sugar, half cup orange juice, yellow rind one orange.

Put sugar, orange juice and a few pieces of yellow orange rind in saucepan, and boil until syrup spins a long thread. Pour on platter and leave until cool. Remove orange rind and work syrup with a broad spatula until white and creamy; then knead until smooth. Keep covered in a glass jar until wanted. Mould into shapes, adding fruit or nuts as desired.

CARE OF THE HANDS

Written for California Cultivator
By A. M. H.

THERE is something wrong with the woman who does not care to have nice looking hands, and just a little daily care will generally keep the hands in good condition. To clean the hands after doing the morning and dinner work, have ready a bowl of warm water, a cake of good soap and a dish of corn meal. First dip the hands in the water then rub on a little soap, and, taking about a teaspoon of corn meal, rub the hands thoroughly with it inside and outside. The soap and meal form a good lather and take off every bit of the dirt. Dry and take another spoonful of meal and rub well into the hands. This will absorb all moisture and leave the skin soft and white. While the hands are still moist, push back the hard skin that grows at the base of the nail with a dry soft towel and this will prevent hang nails from putting in an appearance and improve the shape of the nails. The tips of the fingers should be pressed between the thumb and finger upwards to give them a good shape.

I find it a good plan to keep a bottle of borax solution on the wash stand and use a little in the water each time the hands are washed to soften the water and it helps to keep the skin soft and white. The solution is easily prepared by adding a heaping tablespoon of powdered borax to a quart of hot water. This is especially good to use if the hands are sore or rough.

One of the best lotions for the hands to use at night is made with ten cents worth of glycerine, the juice of two lemons and one tablespoon of powdered borax. This must be stirred until thoroughly mixed.

A splendid remedy for chapped or sore hands is made with one teaspoon of the borax in a teacup of melted mutton tallow. When this becomes hard it can easily be warmed and rubbed over the hands. When gloves are used for sleeping in it is better to slit down the center of the palm, as the gloves should be very soft and loose.

Ink stains on fingers can be quickly removed by wetting and rubbing them with the head of a common match, then washing. Smooth pumice stone is one of the best things to use in removing other kinds of stains from the hands.

It is not always easy to put on gloves when one is in a hurry, but it pays to form the habit if one wants nice looking hands. Have gloves for sweeping, hanging out clothes, for gardening and blacking stoves, and keep these where you can get them at once when needed.

The life that has a motive, something definite to live and work for, is never dreary.

"Hurry, children—I've got a real treat for you."

160 ACRE FARMS IN WESTERN CANADA FREE

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat near $2 a bushel offers great profits to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops.

You can get a Homestead of 160 acres FREE and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of **Oats, Barley and Flax.**

Mixed farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war. The Government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

Gilbert Roche, San Diego, Cal. Canadian Government Exhibit, Canadian Gov't Agt.

DITCHES!

Make the NEW and Clean the OLD with the MARTIN Ditcher, Dyker and Grader. Makes or cleans irrigation or drain ditches up to 4 feet deep—any width. Makes two to three foot dyke or levee; grades roads. Works in sand, rocks, gumbo or clay—wet or dry—on side hills or level ground.

Reversible, Adjustable, No Wheels, Cogs or levers. No breakable parts. All steel. 2, 4 and 6 horse sizes. Guaranteed to do more work than 50 men with shovels. Cost low, upkeep nothing. Over 10,000 satisfied customers everywhere. Write TODAY for catalog, full particulars and introductory offer on new 1917 models.

ONE OF A THOUSAND

"I made six miles of 8-foot ditch in five days with my MARTIN—about one-fifth of the cost by any other method. It is also fine for ditch-cleaning and levee work." H. C. STORMER, Colusa, California.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Unsigned communications receive no attention.

Title

In 1890 my ranch was deeded by its former owner, and as part of the description "the 110 north feet of Lot 17," were transferred in the deed. The same man also owned acreage south of this line. In 1893 he sold a further parcel and in that description included "the south 80 feet of Lot 17". The lots only contain 162½ feet, as per plat and survey. The man who bought the south 80 feet, immediately put a fence around his property and now claims ownership of the 80 feet and refuses to move back the fence. If this is conceded to him I lose 17½ feet of what I bought and instead of owning 110 feet of Lot 17, I only have 82½ feet. Have I not a recourse of some remedy from Title Insurance Company?—Subscriber.

Your grantor sold your property. He certainly could not convey title to anyone else of any portion of that property which he sold to you. Your remedy is, therefore, not against the title company, but by way of ejectment against the party who is unlawfully claiming and holding the property which was deeded to you.

Contract

How does one take back property sold on the installment plan where nothing has been paid for many months and the agreement reads if purchaser fails to fulfill terms it becomes null and void.

It depends very largely upon the attitude of the purchaser. You are entitled to bring action upon your contract either to compel him to perform and pay the money or to rescind the contract and regain the property, or, if the contract has not been recorded, you can convey the property to anyone else. In some instances, under some contracts, it is possible to take summary action as is taken against tenants who fail to pay their rent. It is frequently the case, however, that the arrangement is made with the contract holder whereby he retains the property in return for cancellation of his contract. The particular method which may be taken depends entirely upon the terms of your contract—whether or not it is recorded, and the purpose which you desire to accomplish, and the means and characteristics of the parties. You have several different means which can be adopted.

Chattel Mortgage on Cattle

I understand that in California a chattel mortgage is only effective in the county in which it is recorded. In the event that cattle are grazed in several counties at different intervals during the loan period, it would prove necessary to record the mortgage in each county. Again, at marketing time if the cattle were shipped to another part of the state, how would the mortgagee protect himself?

When personal property mortgaged is thereafter removed from the county in which it is situated, the lien of the mortgage shall not be affected thereby for 30 days after such removal, but after the expiration of such 30 days the property mortgaged is exempt from the operation of the mortgage unless the mortgagee causes the mortgage to be recorded in the county to which the property has been removed, or the mortgagee takes possession of the property. If the mortgagor voluntarily removes or permits the removal of mortgaged property from the county in which it was situated at the time it was mortgaged, the mortgagee may take possession and dispose of the property as a pledge for the payment of the debt though the debt is not due.

The above sections of the code answer all of the questions stated.

Walnuts Over Line

A owns walnut trees having branches which hang over B's fence and drop walnuts on B's property. Has A any right to go on B's land and gather them? What is the California law?

Under the decision of the supreme court of this state heretofore cited in these columns, it would appear that the owner of the tree would have no right whatsoever to trespass upon the property of the adjoining owner to pick up the nuts which it dropped, but he would have the right to gather such nuts, if it was possible so to do, from the tree alone, but when they had dropped upon the land of the adjoining owner, they apparently not only belong to the adjoining owner, but the adjoining owner can bring an action for trespass for allowing such nuts to drop upon his land if any injury was shown.—Subscriber, Los Angeles.

Soldiers' Exemption

Is an honorably discharged soldier of the Spanish-American war exempt from taxation? If so, to what extent? Also, to what extent is a veteran of the Civil War exempt?—Subscriber.

Property to the amount of $1000 of every resident in this state who has served in the army, navy, marine corps, or revenue marine service of the United States in time of war and received an honorable discharge therefrom, or, lacking such amount of property in his own name, so much of the property of the wife as shall be necessary to equal such amount, as well as property to the said amount of the widow resident in this state, or of the widowed mother resident in this state of every person who has so served and died, either during his term of service or after receiving honorable discharge, provided that the exemption shall not apply to any person owning property of the value of $5000 or more. Every honorably discharged soldier, sailor, or marine of the United States or Confederate states who has served in the Civil War, any Indian war, the Spanish-American war, any Philippine insurrection, or in the Chinese relief expedition, who is physically unable to obtain a livelihood by manual labor and who is a qualified elector of the state of California, has the right to hawk, peddle and vend any goods, wares and merchandise, except intoxicating liquors, without payment of any license tax or fee, either municipal, county or state, and is entitled to receive a license to peddle such goods, wares and merchandise from the legislative body of the county or city in which he desires to operate. In order to be entitled to the exemption it is necessary that the applicant therefor make affidavit to the assessor that he comes within the terms of such exemption between the first Monday in March and the first Monday in July. If no such affidavit is given then it is deemed that he waives such exemption, and may be assessed as non-exempt persons.

Enforcing Judgment

If B secures judgment against A in the superior court of Washington, and before an execution is taken A disposes of all his holdings and moves to California and there acquires property which may or may not be in his wife's name, will the judgment rendered in B's favor by the superior court of the state of Washington hold good in the state of California? If so how must B proceed to get an execution on the judgment? If the judgment secured against A out of the courts of the state of Washington will not hold good in California, how must B proceed to collect the debt, or has B no chance of having his claim satisfied? —Subscriber, Coeur d'Alene, Idaho.

In order to enforce a judgment in the state of California or in any state other than the state of Washington, it is necessary to bring an action in the courts of the state wherein the judgment is sought to be enforced, setting forth the judgment obtained and praying relief in the amount thereof. At the time of filing action a writ of attachment may be issued in the state of California upon any property which it is desired to hold to secure the payment of the judgment. No defense can be raised by the defendant to the judgment other than that of payment, satisfaction, release, or want of jurisdiction, the judgment being final and conclusive upon all the merits of the case.

HAY

Scott, Magner & Miller say under date of March 3:

Receipts past week 764 tons, last week 1376 tons, the week preceding 1617 tons. Receipts past week have been insufficient to furnish local demand. The market is higher on all grades.

Several lots held prior to the rains have been sold during the past week at prices in excess of anything heretofore realized. The usual amount has moved for export during the week. Alfalfa is in light supply with demand very good. Straw is scarce and commands full price.

We quote the average wholesale price of hay in carload lots on today's market as follows, viz:

Wheat, Fy., lt. bales .....23.00@24.00
Wheat or Wh. & Oat, No. 1 ...21.00@22.50

Citrus Fruit Market

LOS ANGELES, March 7, 1917.

The storms in California at a time when shipments should have been made to give a big stock for Orange Day prevented as liberal supply as desired. One result is a slight stiffening of the market. Lemons are exceedingly strong. There are practically no foreigns coming and California is making as liberal delivery as possible.

Shipments

Shipments of oranges from Southern California since November 1, 1916, 9880 cars, lemons 2019, total 11,899; to same date last year, oranges 8079, lemons 1922, total 10,001. From Central California to date this year, oranges 4031, lemons 161, total 4190; to same date last year, oranges 4187, lemons 139, total 4326. From Northern California to date this year, oranges 842 cars, last year 609.

NEW ATTACHMENT

Mr. E. E. Gerlinger of the Gerlinger Motor Car Company of Tacoma, Washington, and manufacturer of the "Universal" Tractor Attachment for motor cars, has just made a visit to Los Angeles and San Francisco, completing arrangements for the distribution of the attachments on a large scale in this state.

The "Universal" is the gearing, wheels and other machinery necessary to quickly change an automobile into a powerful tractor. Mr. Gerlinger's Universal is being made to attach to ten different models of autos, a feature that opens wide possibilities to anyone who wishes to farm and make his auto do a part of the work.

Letters from men who have seen demonstrations of the "Universal" in its home state, indicate an enthusiasm for the tractor that could come only from people entirely satisfied with the work done, the low price and serviceability.

Mr. Gerlinger is one of Washington state's big business men who has already achieved success as the manufacturer of motor trucks. As soon as a shipment from the factory arrives several demonstrations of the "Universal" will be announced.

The Los Angeles distributor is Mr. C. H. Mellen, a well known Los Angeles business man, formerly a bank official and with wide and successful sales experience.

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

WHEN you buy a tractor you buy so much metal fashioned into a certain shape, because you expect it to render valuable service. You know that you cannot get more out of any machine than was put into it when built. Paint and fancy fixings do not make a tractor; therefore, buy a tractor that is built right, not merely for looks nor because of unproved claims.

Every year sees a stronger indorsement of the actual service that owners get out of the 15-35 Model E Sandusky Tractor. Built upon thoroughly tried and most exacting specifications, using only the best n.aterials, on correct engineering principles, service and durability are put into it at the start.

The Sandusky Tractor has been thoroughly tested on hundreds of farms, and the universal verdict is that it is the standard by which tractor performance may be judged.

For great power, ease of handling, reliability and durability The Sandusky Tractor excels. Its direct drive on heavy duty work, its reserve power, and its scientific construction put it in a class by itself.

The Sandusky Tractor must demonstrate that it can do your work on your own farm before you can buy it. It will plow, harrow, disc, fill silos, shred fodder, saw wood, pump water, build roads, and do all kinds of belt work more economically, more satisfactorily and more easily than any other method. With it you can prepare a better seed-bed, and do it at the right season, or cut your grain at the right time. It never tires, is not affected by climatic conditions, never gets sick, and it doesn't eat when it's idle.

Farming with The Sandusky is farming certainty. Then why buy any other than the best—why depend on immature or freak designs, much paint and loud talk to do the work that is to make your farm more profitable?

Brief Specifications

Our own four-cylinder, four-cycle, 5 x 6½ heavy duty, slow speed vertical motor; positive combination force feed and splash self-contained oiling system; Bennett air cleaner; three-speed selective transmission, 2 to 5½ miles per hour with direct drive on low; ideal three-point spring suspension; all steel construction; small over-all dimensions and short turning brakes; easily handled; surplus cooling capacity.

A NEW PLAN—FREE SERVICE

We announce an entirely new departure in tractor selling. A coupon book good for 200 hours of service goes with every Model E. This means expert service and help without charge when you want it. See catalog for details.

Our Binding Guarantee

We guarantee The Sandusky Tractor full 15 horse power at the drawbar and 35 on the belt pulley; capable of handling at least four 14-inch moldboard plows eight inches deep where a big team can pull a 12-inch plow six inches deep; to run belt machinery up to a 32-inch separator; to have one-third reserve over its drawbar rating, and for one year against defective workmanship and material.

BOOK E14 FREE—A 40 page book which fully describes and illustrates the distinctive design, high grade construction and exceptional ability of the Sandusky Tractor. A copy will be mailed you upon request.

THE DAUCH MFG. CO., Sandusky, O.

If the Model E is too large for your requirements let us send you information covering our 10-20 Model J. Ask for booklet J-14

The Sandusky Tractors—both Models—are ready for inspection at and delivery from our principal Factory Branches and Service Stations at: Indianapolis, Ind.; Bloomington, Ill.; Milwaukee, Wis.; Lewistown, Mont.; Minot, N. Dak.; Fargo, N. Dak.; Sioux City, Iowa; Lincoln, Nebr.; Wichita, Kans.; Dallas, Texas; Leesburg, Fla.; Los Angeles, Cal.; Sacramento, Cal.

PUT THIS WONDER-WORKER ON YOUR FARM

IT WILL PAY FOR ITSELF IN ONE OR TWO SEASONS

Cuts the COST and the TIME and the LABOR of leveling land down to a minimum

"As far ahead of the Fresno Scraper, as the Tractor is ahead of the Horse—in modern, successful farming."

THE SCHMEISER LAND LEVELER

Takes Most of the Toil Out of Leveling the Soil

—enables two men and a tractor to do the work of a crew of men, a band of horses and a number of Fresnos—with ease and comfort. (The air control on the larger machines is a wonder—makes operation very simple) —puts the high spots into the low spots; transforms ditches, gulches, knolls, ponds and pools into tillable acres of fertile soil. —works on ground too hard and rough and full of tough old knots for a Fresno and horses to touch. Gives the farmer who owns it a start on his neighbors who don't. Spells profit to the progressive contractor.

Made in Sizes Suitable for any Tractor or any Number of Horses

The "Giant"

CAPACITY 4.35 YARDS

$990.00 F. O. B. Davis, Cal.

DIMENSIONS:

Frame made of 5-inch, 9-pound channels, well braced and riveted with ⅝-inch boiler rivets.

Axle of 3½ x 3½-inch square steel with spindles turned down to 3¼ inches.

Rocker Shaft of 2¾-inch Cold Rolled Steel.

Wheels are 5 feet high with 12-inch treads.

Pull Bars of 4-inch channels.

Buckets of ⅜-inch Universal Steel Plates, 11 feet wide, 3 feet high and 4 feet sides with Plow Steel Blade. Bucket has center draw bar to take up strain on center of bucket.

Machine is operated by compressed air.

Weight 5,300 pounds.

The "Junior"

CAPACITY 2.43 YARDS

$715.00 F. O. B. Davis, Cal.

DIMENSIONS:

Frame of 4-inch channels, well braced and riveted with ⅝-inch boiler rivets.

Axle of 2½-inch steel with 2-inch spindles.

Wheels 4 feet high, 6-inch tires.

Pull Bars of 4-inch channels.

Rocker Shaft of 2-inch Cold Rolled Shaft in Cast Iron Bearings. Bucket 8 feet wide, 3 feet high, 3½-foot sides.

Machine operated with compressed air.

Weight 3,000 pounds.

The "Midget"

CAPACITY 1.45 YARDS

$385.00 F. O. B. Davis, Cal.

DIMENSIONS:

Frame of 3-inch channels, well braced and riveted with ⅝-inch boiler rivets.

Axle of 2-inch Steel.

Wheels 3 feet high, 6-inch tires.

Pull Bars of 3-inch channels.

Rocker Shaft of 2-inch Cold Rolled Steel.

Bucket 8 feet wide, 2½ feet high, 2½ feet sides, operated by hand wheel and worm and sector gear or lever.

Works very easily, especially when moving, as the pull on the machine has a tendency to turn the bucket over and release the load.

Weight 1,800 pounds.

In Wonderfully Successful Use Today on the Larger Ranches of California, Arizona, Washington and Nevada

Schmeiser Manufacturing Co.,
22 Mechanic St., Davis, California.

Gentlemen:—Without any obligation on my part, please send me your latest descriptive literature on Schmeiser Land Levelers; also the name of some one in my vicinity now using one of these machines.

Name .....

Address .....

Make and Horsepower of Tractor.....

Number of Acres to Level.....

Send today for further interesting information regarding Schmeiser Land Levelers; also list of names of those now using them in California, Arizona, Washington and Nevada. In writing state acreage you have to level and the make and horsepower of your tractor.

Vol. XLVIII No. II LOS ANGELES: March 17, 1917 One Dollar Yearly

Possibilities in North and Central California

The Sacramento and San Joaquin Valleys and the North Coast Counties Rich in Opportunities. Development Already Great, Must be Still Greater, Especially Along Agricultural Lines.

Written for California Cultivator
By W. D. Egilbert, Secretary California Development Board

IN the space that has been placed at the disposal of the writer for the purpose of presenting a composite review of new developments in the territory from the central San Joaquin Valley to the Oregon line it is only possible to touch, as it were, the high lights of the potential activities that are apparent in the agricultural, water and manufacturing industries of the section indicated.

While it is true that more pronounced systematic utilization of the peculiar natural resources of the state had been developed through publicity and extensive commercial contacts throughout the world by trade relations established through the initiative of Southern California interests, the influx of capital, which makes the necessary entering wedge for commercial advancements, has been tremendously increased in the great interior valleys of California—the San Joaquin and Sacramento with their contiguous sections.

During the last five years pronounced developments of the basic industries, of water and soil, vastly supplemented by the good roads era, have become almost a habit in the interior of California especially referred to in this article. But the years 1915 and 1916 have far surpassed any previous years in the history of the state in the aggregate of potential results as indicated by the unimpeachable statement of bank clearings. The present year, due in some measure to the disturbed trade conditions throughout the civilized world, promises for California the greatest year of money turnover in the history of the commonwealth. Nevertheless, while the upheaval in Europe has played its part in bringing opportunities unthought of to Californians, the expositions of 1915 are immeasurably responsible for California's foremost position on the world's map of achievement.

It is a deplorable but easily demonstrable fact that this Western state has, like numbers of the sisterhood of states, been sadly neglected by the paternal government. Gladly, we are now able to point with distinctive pride as the leading state, looking to the development of the fundamental resources by taking care of foundations. Hence, within two or three years the California state highway system, with its main arteries and laterals connecting every section of this great state, will be pointed to as the most comprehensive system of government built highways in the world; the reclamation, drainage, river and irrigation problems now being masterfully elucidated by state commissions will present to the present and future generations untold advantages of soil and water wealth undreamed of by the pioneers of the western hemisphere. Hardly an activity that tends to the fostering and upbuilding of a community in its most economic sense has been overlooked by the government with which this state has been blessed in the last few years. Educationally, socially, industrially, California is farther advanced than any state in the Union, and with the exception possibly of two foreign countries the most improved community on the sphere.

A great deal of controversial expression has been in a measure inspired regarding the value of the tourist—as to whether the tourist is an asset or a liability. In my opinion the question is not debatable. As a matter of fact, in the first analysis every person who comes to California is a tourist; if he likes the country he stays and becomes one of our producing units or he goes hence, leaving, even in that instance, a few dollars by the wayside. The tourist is a very necessary addition to our community and supplies the most attractive crop that this state can grow and garner. It is a perennial harvest which Southern California is reaping and has reaped for two decades, and in March, the current month, there are more tourists, i.e., traveling inspectors of our state, present in our midst than at any similar time in the past, and this is significant because the tourist season as we have known it does not begin thus early. Approximately the coming of the yearly tourist pilgrimage means, very conservatively estimated, the added circulation in coin of the realm of upwards of $30,000,000. The actual returns from the 1917 crop it is just as conservatively stated will show an increase of at least 25 per cent, and by the end of 1918 California can with perfect assurance rely on the new money advantage of the tourist to the extent of $75,000,000 and upwards per annum.

Southern California, which has so long and so effectively encouraged the coming of the very desirable tourist from every quarter of the globe, reaps at least 75 per cent of the direct benefit from this harvest. It will always be for what we know as Southern California, her wonderful beaches and somnolent climate, to obtain the larger share of the traveling asset of the tourist pilgrimage. More and more, however, is this field being opened up to the sections north of Tehachapi wherein lies the wonders of the Yosemite, the several national forests, delightful beaches of Santa Cruz and Monterey; the "Valley of Heart's Delight" which designates the imperial Santa Clara Valley; the peculiarly attractive environments of San Francisco, the metropolis; the wondrous bay region with its artistic and educational centers; the Marin and North of Bay Counties with their resorts and indigenous redwood forests, "The Cathedrals of Time"; the superb Shasta region, embracing such hoary monarchs as Shasta and Lassen, the sole living volcano in the United States; the peerless Sierra Nevada in which nestle beautiful Tahoe and other lakes; the vast mining section extending from the northern boundary of Siskiyou on either side of the great Sacramento waterway and embracing the Mother Lode and Placer regions, responsible for California's first publicity, and dear to the memory of the pioneer.

A California Redwood Forest
A scene in the timber lands of the Redwood Manufacturers Company.

The development of the watersheds in the interior valleys has added in the last two years upwards of 1,000,000 acres of irrigable land in that territory, and this brings me to a reiteration of the statement that our first thought in California should be the development of the water possibilities. Until the last three years we have been selling our lands to the incoming homeseeker in most cases in a conscientious manner. The question of natural rainfall entered, of course, into the conversation during the negotiations for sale of small or large tracts, but serious thought was not given to the possibility of a dry season now and then and sometimes several seasons in succession. Unfortunately the minds of our legislators and those in authority worked slowly and as a consequence numbers of settlers were placed in a position that made them at least poor boosters for California. Yet, at their very doors was running to waste the purest mountain waters from a thousand streams which only needed harnessing or diverting to make the difference between a poor ranching investment and a competency. Especially so was this position accentuated on the floors of the valleys. And, on the other hand, by the same thoughtless oversight the ravaging rivers and torrential mountain streams were not curbed in the rainy season and ruthlessly carried to destruction millions of dollars of flourishing produce and the means of production. All this, as previously indicated, is being overcome by the care that the state government is giving in recent years to the foundations of our commonwealth, and the potential influence is apparent as has also been stated in the final checking up in the banks' clearing houses.

California has ever been a state of big things and surprises. In 1849 gold was the inspiring word sent round the globe. Thereafter for decades this El Dorado led the world in the production of the yellow metal of commerce. In natural sequence came transportation, the cultivation of great grain ranches, the stocking of ranges and the laying out of orchards; in rapid succession the apple, the peach, the prune, held sway. Orchard, grain field and dairy, lumber mill and factory were interlaced throughout California. Water in the southern arid sections turned the deserts into a paradise. California became the greatest citrus section in the known world. She grows in the valleys of her far southern region dates and tropical fruits superior to those imported from their native soils.

Recently there have been developed industries unthought of 15 years ago. The sugar beet has become again a factor in agricultural communities. With a tariff disturbance the sugar beet industry was impaired for two or three years, but significant, and pointing to a new era, are these observations: In Hamilton, in the northern Sacramento Valley, preparations are being made for the resumption of the sugar beet industry and possibly 5000 acres will be farmed this year. In San Joaquin County the biggest agricultural development of the year was the decision of three different sugar companies to establish factories in that county; each has announced that it will erect plants costing $2,000,000; two will be ready for the 1917 season and the third for 1918. One factory will be located near Tracy, another at Manteca and the other in Stockton.

As cotton has become a large manufacturing influence in the extreme southern part of California, so has its semitropical compeer, rice, developed unusual strength in the San Joaquin and Sacramento Valleys.

In 1912 the experiment in rice which was made in the Butte County section of the Sacramento Valley produced about $100,000 worth of the cereal. In 1916, 60,000 acres, 90 per cent of which area was planted in the Sacramento Valley, produced upwards of $3,000,000 in market value of the tropical water plant. There is no question that in the next few years at least 125,000 acres will be planted to rice in California. It is roughly calculated that there are 150,000, probably 200,000, acres that may be made available for rice culture. The industry has passed the experimental stage notwithstanding the pessimistic reports of United States government in-

ECONOMY

Long-sighted judgment, disregarding first cost, looks for quality in a tractor, for permanence, for lowest cost per working hour, through continual operation and freedom from repairs. That is economy—that is the Caterpillar.

Over thirty years' experience in tractor-building has shown us how to build into the Caterpillar the strongest and longest-lived construction—how to transmit power from the motor to drawbar with least frictional loss.

We will gladly send you details on all models.

IRON AGE

Farm, Garden and Orchard Tools

Answer the farmers' big questions. How can I grow crops with less expense? How can I save in planting potatoes? How make high priced seed go farthest? The IRON AGE Potato Planter solves the labor problem and makes the best use of high priced seed. Means $5 to $50 extra profit per acre. Every seed piece in its place and only one. Saves 1 to 2 bushels seed per acre. Uniform depth; even spacing. We make a full line of potato machinery. Send for booklet today.

vestigators. Product in warehouses should be sufficient evidence of the practicability of rice growing and the profits derived from this form of agriculture is comparable to that obtained from other grains, possibly to the advantage of rice. Water is the essential accompaniment for successful rice growing, and utilization has been made not only of water waste but of land waste in the rice growing regions. Of the 40,000 acres of rice land now being successfully tilled in the Sacramento Valley at least 25,000 acres had been relegated to sheep and cattle grazing. Some of this land has patches of alkali, and rice grown there is firmer and has better marketable properties than rice from other and what were considered more favorable sections. Here then is a use being made of land on a very profitable scale that was for the moment passed into the discard by its owners.

The expansion of farming and industrial interests has been remarkable in the country briefly covered by this article, and naturally the populous centers, such for instance as Fresno, Stockton, Sacramento and other county seats which were advantageously situated for such developments as are now occurring by the prophetic foresight of the founders, show the largest percentage of increase. Oakland and San Francisco together with other Bay communities have surpassed in the last year all previous years as to the number of new factories and industries begun. The investments as to dollars and cents have too in remote cases shown a substantial increase, but the small producing plant is considered attractive and has been encouraged by progressive commercial organizations in greater ratio than in previous times.

In tune with the increased manufacturers' output follows the added equipment and operation of the transportation companies, but specially noticeable is the tremendous advance in river traffic on the San Joaquin and Sacramento Rivers. In 1915 products carried on the San Joaquin River totaled nearly 900,000 tons with a valuation of $37,000,000. Also 215,000 passengers were carried on the river boats. Reliable estimates made for the current period give an increase on these figures of over 20 per cent, and nearly the same situation is shown in a perusal of the statistics gathered over the Sacramento River routes.

Reverting again to the matter of the fostering of industries by our state government, a word here might be said of the extremely practical results being obtained by the operation of the Chico plant station, conducted under the auspices of the United States department of agriculture. No area of 80 acres in the entire United States is producing such fundamental results as this highly cultivated government farm. Men acting as the representatives of the secretary of agriculture, working in the interior of China, Japan, India, Australasia and elsewhere, the pioneers of future fruit and plant industries, are being ably seconded in their courageous efforts to find new fruits and grains applicable to the varying conditions of the climate throughout the United States, and splendid success is following primary efforts. The Chico plant station is one of the show places of California, and will become, as it is better known and its work better understood, an incentive for propagation and development of new horticultural and agricultural products, peculiar at this time to other countries.

There are a number of irrigation projects in this nation that are being operated under more or less successful circumstances, but California is providing some object lessons in irrigation as she has in so many other branches of human endeavor. In Orland, Glenn County, is what is regarded as among one of the most successful irrigation projects undertaken by the United States government. By a beneficial law passed through the California state legislature irrigation districts are being promoted in several sections of California. They are in all stages of development, but some are far enough along to indicate what may be expected in the majority of installations.

In the extreme northern part of the Sacramento Valley what is known as the Anderson-Cottonwood irrigation district, is preparing to provide the

necessary water for at least 60,000 acres of fine land that has thirsted for artificial help in its cultivation. This project, if present estimates are a criterion, should finally cost not more than $30 per acre, which is below the average of cost for similar construction and equipment. There is further irrigation development in Lassen, Modoc, Siskiyou and Trinity Counties, superinduced by the object lesson that the Anderson-Cottonwood district is giving.

It may be generally said that there is not a county in the district touched upon by this article that has not some water problems, looking to future uses of waste water under consideration or actively working out some project. In fact, the state as a general proposition has awakened to the economic loss that has been occasioned by this lack of water usage. Hydroelectric development in the mountain counties, more especially those bordering on the Sierra Nevada, has stimulated thought in regard to water possibilities, and when the statement is made that possibly not more than six per cent of the water coming from the mountains of California is being artificially or profitably utilized, some reason is advanced for the necessity for activity along the lines indicated.

The dairying industry shows a very active advance especially in the coast counties of Humboldt and Monterey, and also in San Benito and Stanislaus. There is a general tendency to the planting of alfalfa in a number of counties that have not developed that industry to any extent and this is another indication of the use of water. A great deal of interest is being shown by the state authorities in the movement among stockmen to increase the herds in this state by the addition of better stock. Cattle, hogs and sheep holdings were largely depleted in 1916. The state university farm at Davis, which is practically an extension course of the university at Berkeley and which was a laughing matter among farmer a few years gone by, is now recognized as the leading institution of its class in the United States, if not in the world. Much public notice was focused on this substantial institution by its winning recently at the Chicago National Cattle Show of two grand champion prizes, the highest awards for cattle in exhibition. Within close proximity to the Davis farm is also the home of the champion Holstein herd of California.

With the extension of the Northwestern Pacific through Mendocino and Humboldt sections and the improvement that has taken place recently in the land transportation service into what were three or four years ago quite remote sections, those wonderful coast counties may look forward with increasing assurance to an attainment of their legitimate goal. The lumber industries of these sections alone would make them potential, but the inspiration that comes from contact with the giant redwoods is certain to bring to those communities an influx of desirable visitors and finally settlers that will well repay the exploitation of that country. The Grand Canyon of the Colorado is viewed by thousands of sightseers as a great wonder of the past; what of the Giant Redwoods? These monarch of the mighty forest, living things before the Christian era, speak with a warmth to the man who gazes upon the marvels that the Grand Canyon cannot express. Here may be the Mecca of the tourist in the near future.

A matter that appeals constantly to interested observers in close association with developments throughout California is the whole-souled interest that is plainly manifested whether in municipal, county or state government in the paternal care of the state's undeveloped resources. In consonance with these thoughts material, practical, systematic operation of water and highway facilities under the fostering influence of the state government is reflected in a more prosperous country side than it was possible to find but a short decade ago.

Imperial Valley melon growers have been informed by the state insectary that the supply of lady birds will be somewhat short this year and that very careful distribution will have to be made in order to handle the aphis pest.

Mr. GRAPE-GROWER

It is almost time for MILDEW

Are you PREPARED for this EMERGENCY which is sure to arise? Have you a GOOD, EFFICIENT, SULPHUR MACHINE? Or are you "putting off" getting one until it is TOO LATE?

Send for the AMERICAN BEAUTY, NOW, and when the time to sulphur comes, YOU will be READY, and YOUR CROPS will be SAFE.

When the rush is on, and every hour counts

THE AMERICAN BEAUTY SULPHUR MACHINE

will do twice the work of any other. GET DONE ON TIME and SAVE YOUR CROPS

REMEMBER: "A puff in time saves the vine."

The AMERICAN BEAUTY works evenly and continuously, and will not choke, clog, or stop feeding for any reason. It delivers the finest screened sulphur you ever put upon a vine, with the least labor. You will hear no "BIRD SHOT" rattling on the leaves with this machine. Our screen has over 400 perforations to the square inch, and this is the finest screen ever used.

Our machine takes the sulphur right from the sack, crushes the lumps, passes it through the extra fine screen, and delivers it in a perfect cloud of fine, clinging, sulphur—without waste. One rancher ran sixteen sacks of sulphur through an AMERICAN BEAUTY last season without trouble of any sort. He will use no other now. It can be filled and mounted in less than three minutes, and has a greater sulphur capacity than any other machine of its size made.

The AMERICAN BEAUTY SULPHUR MACHINE was awarded the BLUE RIBBON and DIPLOMA at the 10TH ANNUAL DISTRICT FAIR at FRESNO—1916. In the HEART of the grape-growing district, where they have every known machine! Doesn't that mean something!

The AMERICAN BEAUTY is not an experiment, not an imitation of any foreign device. It is a California product, designed and built in California by PRACTICAL EXPERTS, to meet the needs of California and West Coast growers. It is the result of two years of work and study, in field and factory, and has been tried and tested under the personal supervision of one of the leading grape-growers of Fresno County. Many models were made, and submitted to the most rigid vineyard tests, weak spots were sought out and corrected, changes were made, till we had obtained the perfectly working machine we are offering you today.

REMEMBER, YOUR CROPS MEAN MONEY. A few hours lost at a critical time may cost you all your profits. DON'T WAIT. Insure a good yield by being prepared. Here is our proposition. Send us $11, and we will send you a complete machine, ALL CHARGES PAID, and guaranteed to be all we claim. Try it for a week. If you are not entirely satisfied, return it, in good condition, AT OUR EXPENSE and we will cheerfully refund your money.

REMEMBER, WE FULLY GUARANTEE EVERY MACHINE

Teague Trees are Quality Productive Trees

Because properly grown and budded from selected trees producing abundantly only quality fruit. Buds cut from carefully selected fruiting bud-wood only. In addition we give quality service in the way of digging, packing and delivery that insures success to the planter. Correspondence and inspection invited; our treatise on "Citrus Culture" and annual Price List sent on application.

R. M. TEAGUE, Manager
San Dimas, California

Legumes are plants that bear their seeds in pods. They take nitrogen from the air and store it in the soil, thus increasing the fertility and available plant food of all soils in which legumes grow. Field grains are not legumes.

Seed inoculation means putting on legume seed the pure culture bacteria such as "Nitragin." Inoculation strengthens the tiny legume plant from the moment the seed sprouts, and under proper soil conditions insures a "catch" which you otherwise could not get.

YOUR HOUSE ROBBED AND BURNED

Inoculated **Not inoculated**
Two soy beans. The large one showing growth because of inoculation of seed with "Nitragin." The smaller without inoculation. Both grown under same conditions.

Inoculated **Not Inoculated**
Two alfalfa plants of the same age started in the same soil, under the same conditions—one inoculated with "Nitragin," the other no inoculation whatever.

Inoculated **Not Inoculated**
Two clover plants. The larger grown from seed inoculated with "Nitragin"—the smaller without inoculation. Both grown under same soil conditions.

IF YOU were away from home and picked up a newspaper and the first thing you saw was the headline like that above, you would be interested right away because your home is the closest to your heart.

What we want to talk to you about is the robbery and destruction that is going on right on your farm every year, absolutely and positively, no matter where you live—not to the extent of a few silver spoons, knives, forks, jewelry and silver dollars—but to the extent of thousands upon thousands of dollars that **justly belong to you now.** You are not getting them, no matter where you live or how rich you think your soil is. This is just as true as you are reading this advertisement, and we can prove every word of it if you will give us a chance.

Look Here!

Statistics show that the cost of crops annually is getting higher—that the annual production in bushels to the acre is getting lower.

What's the reason?

There is only one reason. You yourself and your tenants have gone out like masked men with dark lanterns and deliberately robbed the soil. Will you be serious enough to read all this advertisement? If you will, and will put into execution the information we are giving you, you can get thousands of dollars that you have not been getting, and that you never will get if you don't follow the course we have outlined here.

Talk About Fortunes!

Combine the wealth of all the railroads, the steel mills and the other industries and these figures would look small compared to the value of the increased crops that could be produced in the United States if all the farmers of the country would properly rotate their crops with legumes properly inoculated with "Nitragin" which has been proven, tried out and tested as the best legume inoculator.

What Is Nitragin?

"Nitragin" is a bacteria product originally discovered by Nobbe & Hiltner, famous German scientists, for the purpose of properly inoculating legumes, intensifying the growth and collection of free nitrogen at the roots of the legume plants, which makes the legume crop itself more productive, and intensifies and makes greater any crop that follows.

Everybody Knows

That a good clover field when turned under and followed with corn means, with proper cultivation and good seed, a bigger corn crop.

It was Nobbe & Hiltner who found out why this is the case!

They found out that on the roots of clover there were naturally small lumps or nodules which contained nitrogen, and it was through the clover plant and other legumes that this nitrogen-gathering process took place. Then they immediately went to work and produced an improved bacteria culture, the use of which caused the growth of more and larger nodules on the roots of the legume plants. These nodules bring the free nitrogen from the air into the soil for plant food.

Now to the man who is not familiar with these facts this story may sound peculiar, but it is no more of a mystery when you understand it than milking a cow and using it for food purposes.

Every acre of land in the corn belt if properly rotated with inoculated legume crops is worth $300 to $600 an acre and will pay crop dividends on this valuation, but you can't do it by cropping it to corn and grain every year, nor by putting in uninoculated legume seeds. You must inoculate if you want to get the nitrogen back into your soil. "Nitragin" inoculated legumes are the solution!

INSURES LEGUME CROPS

NOBBE-HILTNER PROCESS

NITRAGIN

PURE CULTURE

Reg. Dec. 6, 1898 No. 32212

FAMOUS LEGUME SEED INOCULATOR

Dr. Cyril Hopkins

the soil scientist of Urbana, Illinois, says there is over $1,000,000 worth of free nitrogen in the air over every acre of soil in the United States! Now the question with you is, "How can you get your share of it?"

The answer is—through "Nitragin" inoculated legume crops. Legume crops are such crops as alfalfa, clover, soy beans, cowpeas, vetch, etc.

Now sit right down and calmly figure out what this means to you in dollars and cents, and you have the answer, and the reason why we say that you and your neighbors are the biggest robbers and do more injury to your own pocketbook than a band of robbers that break into your house, steal your valuables, set it on fire and get away uncaught!

An Extract From Soil Science

which gives you the facts regarding "Nitragin" compared to other bacteria cultures:

"It is clear, therefore, that soy bean plants devoid of inoculation, not only fail to produce a large yield of dry matter when the soil is deficient in available nitrogen, but also contain a much smaller proportion of nitrogen in the plant substance that is usually found in plants that are properly inoculated. **It may be pointed out, also, that there were marked differences in the effectiveness of the different cultures as well as the different soils employed as inoculating material. Among the commercial cultures used, "NITRAGIN" was evidently the most effective inoculating material."**

"NITRAGIN" IS NOT AN EXPENSE

but it is called by many who have used it, "legume crop insurance." Many a farmer wonders why he doesn't get a "catch" of clover, alfalfa, and other legumes, blaming the weather or climatic conditions, when as a matter of fact, the trouble is he has mined out every natural trace of nitrogen from the soil, so that when the clover, a natural bacteria-gathering crop, is put in, the soil does not have enough bacteria to start the nodules growing. The farmer foolishly places the blame on the weather when it is his own fault by neglecting to put in properly inoculated legume crops. In this way he loses his valuable clover and other legume seed, foolishly trying year after year to get a "catch" when it is not the weather nor the seed, nor anything else, except lack of inoculation.

If you want to know more about "Nitragin" before you order we will gladly send you our booklet "Legume Growing" and other literature. **Ask for it today!**

Some of the Big Institutions of Northern California

Written for California Cultivator By M. C. Holman, Manager of Our Northern Office at San Francisco.

GREAT centers have grown up in Northern California, where were once mere trading stations, and the accumulation of industries has given a tremendous impetus to the immediate vicinity. Railroad conditions are most excellent and transportation by water is almost universal. It is through the facility of transportation that we have seen the great industries come into our midst and grow with exceeding strength until today they rank with the largest in the world and their products are sought from every quarter. This is particularly true in the machinery line, for California machinery is now humming all over the world. The giant tractors are doing every kind of work from pulling plows in China to transporting the huge artillery pieces of the European armies.

And the opportunities have by no means been exhausted. So long as we enjoy the invigorating climate, just that long will our industries continue to grow and just that long will new enterprises continue to become established. The future for Northern California is most promising. Recently some of the very largest institutions of the East have established large branch factories, particularly in the line of automobiles and accessories. New lines of railroads are being constantly laid and branch tracks are making available the broad stretches of land adjacent to the main lines, while wharves and docks are being constructed on rivers and bays, giving to the commercial interests that communication with the outside world which is absolutely essential to a successful manufacturing business. To accommodate its enormous increase in business the Southern Pacific Company is now constructing on Market Street, near the Ferry Building, in San Francisco, one of the largest buildings west of Chicago.

In this article we want to call the attention of our readers to some of the big things that thrive in Northern California. We want you to know and see what is being done in this end of the state. We want to encourage a friendly communication between all parts of this great state. The story of Northern California is a story of broad minded principles in business and social actions.

There is perhaps no single company that has larger holdings and business than the Redwood Manufacturers Company of San Francisco and Pittsburg, California. But it is not alone to these two cities that the business is confined, for, far to the north in the giant redwood forests this company owns vast tracts of the priceless timber from which it draws its supply of redwood for the manufacture of its products.

The company has designed, manufactured and installed redwood pipe and redwood tanks continuously since 1889. In the 28 years elapsing since this company began business it has installed thousands of tanks, hundreds of miles of redwood pipe, and in recent years has placed on the market a silo that will meet every requirement, that is good from the start and that will last many years after the so-called "cheaper" silos have fallen apart and been discarded. Their trade name "Remco" is known all over the United States, the East Indies, the Hawaiian Islands, Central America, South America and Mexico as a synonym for "perfection of design and quality". As is natural where such perfection is adhered to by a manufacturing institution, their business has grown to enormous proportions. For many years their main business lay with the municipal pipe lines and big mining installations, and it is only in recent years that they have devoted special attention to installations on farms. The Redwood Manufacturers Company's installations are designed, the construction superintended by, and the installations made by trained engineers. This is of immense benefit to the buyer, especially the small buyer who does not care to go to the expense of hiring engineers to look after such matters. It is also a great benefit to the small buyer to do business direct with manufacturers who have a vital interest in the products they sell. It is a matter of pride with the Redwood Manufacturers Company, dating back to their first installation, that no product bearing the name "Remco" shall be of inferior quality, but must measure up to the fine standard that has made the word "Remco" a specification of all that is perfect in pipe, tank and silo construction.

In the city of Stockton are assembled some of the greatest institutions to be found on the entire coast. Their products reach every part of the world. The largest flour mills in the state, those of Sperry Flour Company, are situated there. In giant buildings, several stories in height, are manufactured a complete line of various kinds of flour and other foods. It is safe to say that there is not a family in the West but has enjoyed a breakfast dish, or delightful bread from the products of this great mill. The view here presented shows to very good advantage the office, the cereal mill and the flour mill buildings of the Sperry Company, located in the center of the manufacturing district of Stockton. The overhead conveyor illustrates the manner in which products are transported from or to the cereal mill in loading or unloading boats docked at the wharf.

Sperry Flour Co., Stockton

The cereal mill in 1916 produced 16,240,000 pounds. During the same period the flour mills turned out 97,295,600 pounds of flour. At the Crown mills, not shown in this picture, stock and poultry foods are manufactured, the output last year amounting to 64,032,000 pounds. All these mills have been running to their maximum capacity the past year, their total production of 177,367,600 pounds making Stockton the milling center of California.

No story of the industries of Northern California would be complete without a considerable mention of the great tractor interests, and two of the largest factories are situated in Stockton. The broad expanse of territory occupied by the Holt Company is evidence of the great volume of its output, and when we consider that new buildings are constantly being erected for the increased business of the plant, we can realize that the business, large as it is, is still growing and that the tractor is coming more and more to be the great working unit in the development of California. An account of the activities of this concern is given on another page of this issue.

We have watched with a great deal of pleasure the hum of wheels and the rapid cutting of the big lathes at the factory of the Samson Iron Works where the justly famous Sieve Grip tractors are made. It is not to be wondered at that the company is several months behind in its orders, for the Samson tractor has met a big

TALKS ON

Nitrogenous Fertilization

Number 11

WHAT do you pay for in a ton of fertilizer? Plant-food, of course! But your fertilizer is not all plant-food, by any means. It contains other substances which necessarily enter into the chemicals and mixtures. Actual plant-food is indicated by the guaranteed analysis, and the fertilizer that carries more of the plant-food your soil needs is the best one for you to use.

SULPHATE OF AMMONIA

In buying Sulphate of Ammonia you pay for nitrogen, about the most essential plant-food in California soils, true enough; *but*, in a ton of Sulphate of Ammonia you buy *more* nitrogen—*more* pounds of active, available, lasting plant-food—than you can buy in a ton of any other nitrogenous fertilizer.

That means that each pound of plant-food in Sulphate of Ammonia receives the *lowest* charge for cost of production, transportation, handling, storing, and distribution on the farm.

Sulphate of Ammonia, because of its reliable, uniform composition, its superior mechanical condition and its easy distribution, is the simplest of fertilizers to handle on the farm.

In field and orchard, on lawn or meadow, for truck and garden crops, applications of from 100 to 300 pounds per acre give splendid returns.

need in farming lines. See article on another page.

But it is not to Stockton that the great tractor industry is confined, for its immensity far outstrips the limits of any city or any community, and it seeks an opening wherever conditions are right. They are right at Marysville and Benicia. The Yuba Manufacturing Company has long been at Marysville and has recently leased a big factory at Benicia for the production of the famous Yuba Ball Tread tractor.

This company was formerly known as the Yuba Construction Company, but Yuba Manufacturing Company is the new name, the change being made on February 15, 1917, to cover its greatly widened activities. It reports that this plant could run the remainder of the year on tractor, plow and dredge orders already booked. However, to take care of this increased business the plant at Benicia was leased. The small tractor, called the Model 12-20 recently marketed by this company has attracted much interest among vineyardists, as it appears to have the power to disk between ten foot vines at one cut and yet is narrow enough to go in seven foot vines. This concern has also recently announced a new heavy four-disk plow with a wide clearance suitable for plowing in tule land.

One of the latest arrivals in the tractor business is the Joshua Hendy Company of San Francisco and Sunnyvale. This company has been a big factor in the mining industry of the state, and being desirous of further broadening its scope has taken up the manufacture of the tractor and now has on the market the Invincible and the Paragon. The Invincible is of the wheel type, while the Paragon is of the track laying type. Like the other tractor companies the Joshua Hendy Company is oversold and is working nights at its big Sunnyvale factory.

In general manufacture no company in Northern California has achieved greater success or done more for the farmer than the Schmeiser Manufacturing Company of Davis, the company with the phrase "The Schmeiser way makes farming pay". Having begun in a small way it has gradually increased its capacity until today the Schmeiser hay derrick and the Schmeiser scraper are synonymous with successful agriculture. The attention of this company has been centered upon the things of the farm that make farm life more enjoyable and at the same time more profitable. Its equalizing hitch has made the lazy mule do the same work as the energetic one, thus getting full value out of all the horse flesh or mule flesh that may be working at that particular pull. It also manufactures a wooden land leveler that is a wonder in simplicity of construction, effectiveness of operation and results obtained. It is 12 feet wide and 30 feet long. It will level from 20 to 50 acres per day and is guaranteed to be far superior to the old style Fresno scraper. There is also a very creditable checker made by this company. The standard size is 20 feet wide at the front and 24 feet long. It tapers from front to rear and will check from 40 to 80 acres per day at a cost of less than 50 cents per acre.

We may think of San Jose as being in the center of the great prune industry, but it is also true that the city harbors considerable activity along manufacturing lines, chief of which is the great factory of the Bean Spray Pump Company, which occupies several acres of ground with buildings, and employs over 200 men. It had its beginning in 1884 when Mr. John Bean, the founder, exhibited his home made high pressure spray pump which he had made to fight the San Jose scale that infested his orchard at Los Gatos. There was an instant demand for the pump and a factory was started, not on large proportions, but founded upon the principle that makes large institutions whether they start small or not. That principle was to make what was made better than any one else could make it. And that has been the policy of the company from its inception through the many successful years of its existence till its present great proportions as the biggest factory in San Jose.

The company has not confined its activities to the manufacture of spray pumps, for it also makes centrifugal pumps and stationary engines. The latest addition is the Bean Track Pull tractor. This tractor, which was two years in building, has sprung into popular favor, and the company has been forced to keep the tractor division running nights to keep within calling distance of the demands made upon it for the light running, economical and serviceable tractor.

Not far from the plant of the Bean Spray Pump Company in San Jose is the new mammoth factory of the Smith Manufacturing Company. This plant, like most successful enterprises, had a very small beginning in a little old building in San Jose. Mr. Smith has always been interested in the manufacture of fruit drying and grading machines, and it is upon these machines that he has made his great success. After some years the company moved into larger and more pretentious quarters, but it was only within the past six months that it has

KNOW YOUR SOIL

Many Soils That Look All Right Fail to Produce Good Crops

If you are not getting a full crop from your land—no matter whether it is set to alfalfa, fruit or grain—it is very probable that the principal fault is in the soil itself.

Looks don't count with soils, for many a fine-looking soil is deficient in some of the elements necessary to produce a good crop.

It costs just as much to cultivate a poor soil as it does one that is perfect. The difference in the crop obtained, however, often measures the difference between success and failure for the farmer.

Many ranchers who realize this fact have hesitated to have their soil analyzed on account of the knowledge that soil experts are expensive. All such will learn with interest, therefore, that a little machine has been devised, which will not only test soil accurately but will show just what is needed to bring it up to the maximum of bearing efficiency.

The initial cost of this little machine is very nominal, considering its earning ability in greatly increased crops. Once the device is obtained, the cost of each soil test is only a few cents.

No experience or technical knowledge is required to operate this soil tester; in fact, thousands of them are now in use by ordinary ranchers in all parts of the country.

These wonderful machines, which are fully guaranteed, are being placed upon the market under the name of the "Standard Soil Tester". They are being distributed on the Pacific Coast by Mr. Clement B. Stern, 612 Central Mortgage Building, San Diego, California, who will be glad to mail prices, testimonials and full information concerning them, to any reader of this paper who will simply drop him a line.

Government Lands

DO YOU KNOW that you may now apply for any of 600,000 acres of California School Land? Do you know there are 20,000,000 acres of Government Land in California, some in nearly every county that is vacant? Some of it was taken years ago and allowed to come back to Government; now supposed to belong to absent owners. It will pay you to send for our full service; $5 for lists, any 3 counties; $2.50 each for 3 county sectional maps; $2.50 for School Land State Map; total $15. While we will send you any part of this service, we know that those who send for complete service get best bargains, better satisfied, get the best results. We recommend their plan to you. Write now. New booklet. Joseph Clark, Manager, California State Land Information Bureau, 1511 K St., Sacramento.

FILL IT ONLY ONCE A WEEK

made its great stride and moved into a commanding edifice that covers two acres and gives employment to more than 50 men. Mr. Smith has been a stickler for quality and has maintained it throughout his successful career.

To completely supply the dairy needs of the state the De Laval Dairy Supply Company was organized and incorporated in March, 1902. At that time the dairy industry of California, as compared with its present magnitude, was what might be termed in its infancy. The company pioneered the introduction of the cream separator in California and the company's growth has gone hand in hand with the dairy industry of the state.

It has been the policy and constant aim of the De Laval Company from its inception not merely to sell goods for profit, but to build its business by lending its energies and resources to the up-building of the dairy industry of the entire Pacific Coast. The company has endeavored to raise the business of dairying to a high plane; to make it a profitable business by the development and introduction of better dairy apparatus. It has been a constant advocate of better cattle, improved methods of feeding and proper housing under sanitary conditions. The advantages of the silo, and the saving of feed through the use of a feed cutter have been pioneered by this company and these, in conjunction with improved conditions, have not only made dairying a profitable business but have enabled the production of a cleaner and more wholesome product. The De Laval is now the most extensive line of up-to-date dairy equipment on the Pacific Coast.

The soil of Northern California, being fertile in the extreme, requires an abundance of seeds to meet its requirements and to fill the demands two great seed houses have grown from small beginnings to their present large proportions. We refer particularly to the Morse Seed Company of San Francisco and the Valley Seed Company of Sacramento. The Morse Company is the largest institution of its kind on the coast and its seeds are found in every domestic and foreign market. It grows its own seeds and specializes on sweet pea seeds, of which it grows a larger number than any other seed company in the United States. Its beautiful catalogue is a general guide to thousands of planters.

The Valley Seed Company of Sacramento began in most unpretentious surroundings, but the Ward Brothers, ambitious and energetic to the extreme, soon moved into a new building with quite pretentious accommodations. They have conducted their business upon the lines of giving the greatest possible value in reliable seeds, and the success of their endeavors is shown in their present mammoth business.

Of exceeding importance is the manufacture of pest destroying sprays. Without some means of eradicating pests California would be devoid of her luscious fruit and her quantities of vegetables. The California Rex Spray Company of Benicia meets the great need by supplying its famous Rex Brand of sprays in barrels, buckets and cans. This company conducts a tremendous business and its sprays are eagerly sought where perfection of fruit is desired.

We are pleased to have been able to mention some of the big industries of the northern part of the state, but we have been able to merely scratch the surface, as it were. Northern California is a veritable bee hive of work. Energy, activity and perseverance are the bone and sinews of this delightful section, and he who would seek to establish himself in any manufacturing enterprise should lay his plans looking toward the north where no man wilteth in the sun or freezeth in the cold.

It would be impossible to enumerate all of the big institutions that thrive in Northern California or to mention all of the sections where certain businesses are active. We could refer to the poultry business of Petaluma, San Jose, Sacramento, and Hayward; to the prune industry of the Santa Clara Valley, to the raisins of Fresno, to the oranges of Oroville, the olives of the upper Sacramento valley and dozens of other similar enterprises, all great in themselves. Further information touching any portion of Northern California may be had for the asking.

"I Would rather be Right than be President"
H. Clay

TO have the right standard and faithfully live up to it, this is the working motto of the Firestone Organization. Since Mr. Firestone founded the Company seventeen years ago, there has been no swerving from this quality rule. Success has come because Firestone standard is "right" and every member of the Organization upholds it.

The standard means that you must get riding comfort in the highest degree with a safe hold and Most Miles per Dollar on any road, through the whole year. Mr. Firestone's name on the tire is your assurance of this.

The Right Power at the Right Time

THE Advance-Rumely "8-16" gives a man a chance to take advantage of weather conditions instead of being at their mercy. Whether it is plow quick, or harvest on time—the 8-16 is able and ready to do every farm operation at the time *best suited to bring maximum results.*

In the first place, it is a one-man all purpose outfit. Plowing is made a one-man job because tractor and plows are combined in one machine, and full control is from the driver's seat—with the Advance-Rumely you plow as with a horse gang, the work always in sight. You can back up with your plows, make short turns and cut square corners.

For handling other ground working equipment, hauling and belt work, the 8-16 is just as efficient and easy to handle, as you merely detach the plows and plow frame and it's ready for any drawbar or belt job you put up to it.

And it burns cheap kerosene with full efficiency—not only at full load but at variable loads or continuous light loads.

The catalog shows in detail the powerful four-cylinder motor and the other features that make the "8-16" a tractor that fits to perfection the small and medium size farm. Also built in three plow size—"12-24" H. P.

Smooth Lock Seam Sleeve

Here is an exclusive Madewell feature that appeals to every user of Surface Pipe. Seamed inside with perfectly smooth surface. Much stronger than the old-fashioned lapped and riveted seam used by others.

Madewell Surface Pipe

is recognized in established surface pipe districts as having the strongest, smoothest, and most practical construction.

Our Long Lock Seam is the best seam possible to make—and in addition is carefully soldered the entire length so that it stays water-tight. **Strength and Smooth Finish** are the big things to consider when you invest in surface pipe.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

Robinson Hardware Co. Box C Gilroy, Cal.

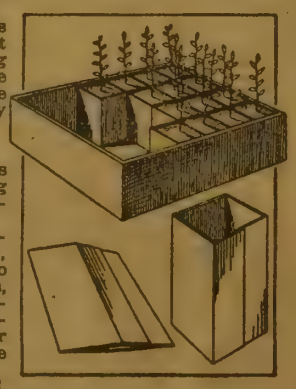
Perforated Tree Protector

that will keep Squirrels, Rabbits and Gophers from barking your trees and give perfect protection from hot sun, sandstorms, barking in cultivation, etc. Tell us your pest and we will tell you what kind of a wrap to use. We make a number of kinds and can save every tree for you from pests.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, never disturbing your plant nor stopping its growth in transplanting a single hour.

For starting early vegetables, such as Tomatoes, Cabbage, Eggplant, Cauliflower, Cucumbers, Cantaloupes and Squash; also for propagating Rose Cuttings, Geraniums, Eucalyptus and Conifers. It's the only practical pot on the market today for propagating work. Write us for samples of either Pots or Protectors. Tell us which you are interested in.



THE EXPAN CO., 935 E. Central Ave., Redlands, Cal.

Samson Sieve-Grip Tractor Co.

FIFTEEN years ago the Samson Sieve-Grip Tractor Company (then Samson Iron Works, Inc.) built its first Samson tractor. This powerful, medium sized tractor was placed on a farm near Stockton where its operation could be closely observed by the company's engineers. Several more Samsons were built during the next ten years and many improvements made as each model was tested.

From the first it had been the actuating idea to have a small tractor that would meet the power demands of the average size farm. In 1902 the great majority of farm tractors were large machines of from 80 to 100 horsepower. Lately the same companies that manufacture these mechanical monsters have begun to build medium and small tractors, but the Samson Sieve-Grip Tractor Company has always built small tractors!

As a pioneer in the small tractor field it is little wonder that the Samson Sieve-Grip tractor of today is giving the splendid service that it is to farmers all over the world. For five years Samson Sieve-Grips have been manufactured and sold in ever increasing numbers. Now the large Stockton plant of the company is devoted exclusively to the production of Samson Sieve-Grips, whose sale is limited only by the Samson plant's capacity for producing them.

The Samson Iron Works was started in 1898 by J. M. Kroyer as a small machine shop in Stockton. In the first ten years of 1900 it manufactured more stationary engines and pumps than any other company on the Pacific Coast. With his usual foresight Mr. Kroyer selected the small tractor business as a line for the company. The remarkable growth of the tractor industry in the last few years has proved the wisdom of this choice.

In four years the sales of the Samson Sieve-Grips grew to such proportions that in the fall of 1916 it was decided to build only these tractors.

Samson Sieve-Grip Tractor So., Stockton

letting the pump and engine business have a secondary consideration.

The distribution of Samson Sieve-Grips covers the territory west of the Rockies and a Samson plant will soon be in operation in the Middle West. Connections have been made with many foreign countries, and the exportation of Samson Sieve-Grips is only limited by the transportation and manufacturing facilities.

The Samson Sieve-Grip Tractor Company through adhering to a policy of fair dealing and quality construction has developed in less than 20 years into a company of international standing. It is a concern of which every Californian can be proud, for it is Californian all the way through and embodies the live, robust spirt of the West.

Soil Bacteria---Its History and Uses

IN the days of ancient Rome and during the following centuries those men engaged in tilling the soil and raising crops for the sustenance of themselves and their fellow mortals, noticed that cereal crops planted in fields where peas, beans, vetches or clovers had grown yielded more bounteously, but until the latter part of the nineteenth century the reason for such improvement was not understood.

Early investigators observed that tubercles or nodules formed upon the roots of those plants, and were of the opinion that they were harmful and should be eliminated from the plants if possible, but about the year 1880 it was discovered through soil analysis that the nitrogen content of fields was increased by the growth of such plants, and seven or eight years later a German scientist, Hellriegel, after long experiment announced to the world that those plants, the legumes, made use of nitrogen taken from the air, not directly, however, but through the tubercles or nodules which formed on their roots, and that the nitrogen was absorbed or gathered from the air between the soil particles by infinitely small living things called bacteria, which had their homes in the tubercles.

It has since been established beyond question that the members of the family of bacteria known as Bacillus Radicicola, which live in the nodules on the roots of legumes, have the ability of taking from the air that chemical element which is the most necessary to vegetation, nitrogen, and of supplying it to the host plant on whose roots they live in such quantities and at such times as it is needed, generally leaving a surplus in the soil for the benefit of succeeding crops. Further, it has been definitely proved that each one of the family of leguminous plants has a bacterium peculiar to itself and that those bacteria which form nodules on the roots of clover, for instance, will not colonize and form nodules on the roots of peas and will not supply pea plants with nitrogen.

These bacteria are so small as to be visible only under a microscope of the highest power. Legumes grown in soil which does not contain the bacteria peculiar and necessary to them, no matter what other bacteria are in the soil, do not have nodules on their roots and therefore are unable to use atmospheric nitrogen, being dependent solely on such nitrogen as may be in the soil in available form, and it is well known that soil nitrogen is not available to plant use until converted into nitrates by the nitrifying bacteria.

One of the most important things observed from the use of legume crops is that they are fertilizers and restorers of worn out soil. If a crop of vetch, peas or clover be plowed under there is returned to the soil not only the chemical elements which enter into the composition of the roots, stems and leaves of the plants, but also the nitrogen which has been gathered by the bacteria and stored up in the tubercles or nodules. These nodules are about eight per cent nitrogen in available form, and the value of such nitrogen per acre added to the soil by a crop of vetch or clover plowed under as a green manure has been established by the University of California experiment station at Riverside as the equivalent of 108 pounds of nitrate of soda.

Following the discovery of nitrogen fixing bacteria experiments were made in transferring them from places where they were abundant to places where legumes would not grow for lack of them. There are many parts of the United States where legume crops will not grow and many more parts where they will not thrive for the same reason. By inoculation a successful stand of alfalfa or other clover and a good crop of beans, peas or other legume is assured.

The transfer of inoculated soil from one field to another is known as the soil transfer method. Another practice known as the soil suspension

method consists of placing the roots of leguminous plants with the adhering soil in water and later sprinkling the seed to be planted with this water.

Both of these methods of inoculation were largely practiced but both are rapidly going out of favor.

1. Taking soil from fields and transporting it to other fields is not only expensive and laborious but dangerous, as moulds, fungus diseases, weeds and denitrifying bacteria may be transported with it. The soil suspension method is laborious and dangerous for the same reason.

2. The beneficial bacteria are most numerous in the uppermost foot or eighteen inches of soil and no one having a good soil, well filled with humus and bacteria, would care to give the best portion of his field to his neighbor.

3. Pure cultures are readily obtainable, easily applied and comparatively cheap.

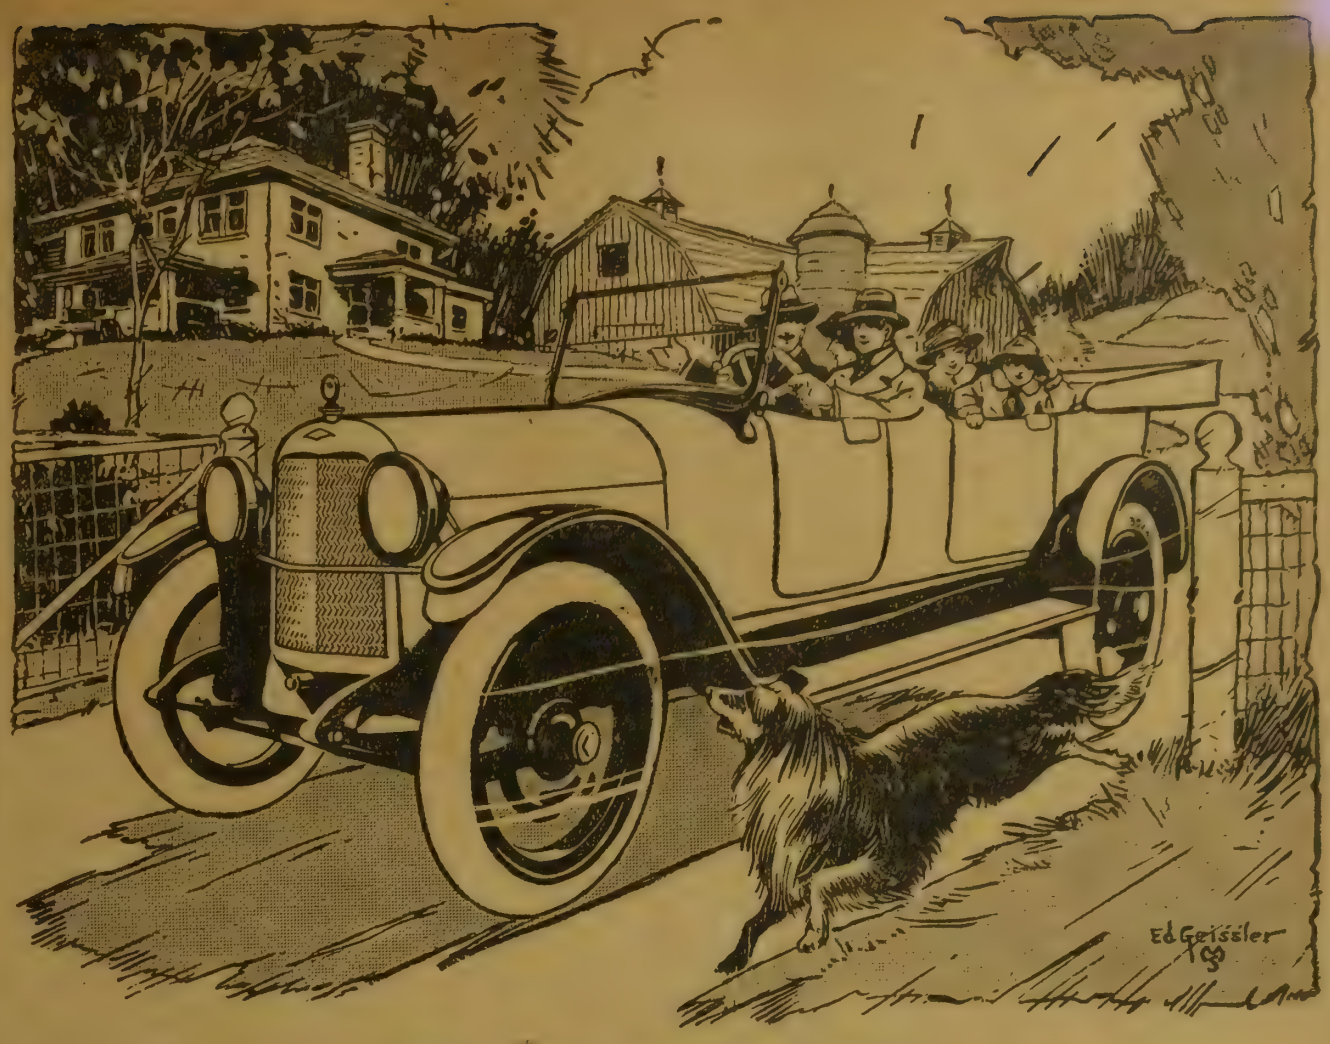
The difficulty of inoculation by soil transfer led to attempts to breed and use pure cultures of bacteria taken directly from the nodules. To obtain and breed them in quantities sufficient for shipment and use was easy, but to find a proper medium in which they could be shipped, wherein during their travels, their life and strength could be preserved, was very difficult and the subject of long and anxious experiment. The first trial made was by placing the bacteria on absorbent cotton, but it failed because the cotton dried during shipment, and the bacteria died for lack of moisture. Other substances were used, liquid, gelatinous and solid, and after much patient research work a composite substance has been found in which the bacteria will live and thrive for many months.

A World-Famous Factory and Its Products

NOT only is the Holt factory at Stockton the largest one devoted to the manufacture of farm machinery west of the Mississippi River, but The Holt Company also bears the distinction of being the first and probably the only company that had its beginnings in the West and later reached out with branch offices and a factory into the territory east of the Rockies. This factory was established in 1883 by Benjamin Holt, who conceived the idea of the Holt Combined Harvester, which in one operation cuts, threshes, cleans and sacks the grain ready for market. Holt Combined Harvesters now cut and thresh 90 per cent of the grain harvested on the Pacific Coast.

The first combined harvesters were pulled by horses, then Benjamin Holt saw the possibilities of using the power of steam, which was only beginning to be used for tractive power on the farm. Steam engines of from 60 to 100 horsepower were produced in the Holt plant and these giant engines were used not only for harvesting but also for plowing and freighting for the mines and lumber mills in the high Sierra. An early improvement in the harvester drawn by the steam engine was the mounting of an auxiliary engine on the harvester for operating the threshing mechanism, this engine receiving its steam from the tractor's boiler. Auxiliary engines were also mounted on ore and freighting wagons for use in mountain climbing. These improvements made it possible to haul loads over very steep mountain roads and to raise and harvest crops on hillsides that had been fit only for grazing purposes before.

But although these outfits were the best of their day, they were not perfection in the eyes of Benjamin Holt. He dreamed of a tractor that would be but little wider than a team of horses, as powerful as 30 or 40 and yet be able to go over the softest land fitted for agricultural uses. To make this dream come true he discarded wheels altogether and equipped his tractors with the endless belt track which was laid down, rolled over upon and picked up again as the engine moved forward. This wonderful invention, the Caterpillar track, which has carried Benjamin Holt's fame to every part of the world, proved a complete success. Exhaustive shop and field tests costing this company years of time and many thousands of dollars have developed it and brought it to its present stage of perfection. The name



PAIGE

The Most Beautiful Car in America

Power, Beauty and Dependability

FEW of us have the need or desire for a racing car.

We are quite content to let the "other fellow" take his chances at 70 miles an hour—while we spin along comfortably and safely with the speedometer needle registering 25 or 30.

But every man wants Power in his automobile—and particularly the farmer.

It is good to sit behind a motor which responds eagerly—buoyantly—to the slightest touch of the throttle.

It is good to know that you need only "step on" the accelerator—and the steepest hills will flatten out like smooth boulevards.

It is good to realize that you command a vast store of reserve power which will easily take you through the heaviest sand roads "on high."

It is good to know that your automobile is a staunch, sturdy, dependable help-mate—not a treacherous weakling that will lay down when the real work begins.

In a word, it is good to own just such a car as the five-passenger Paige Linwood "Six-39." This car is a thoroughbred—every inch of it.

It is just as handsome as an automobile could possibly be, and easily capable of doing 60 miles per hour if you desire to travel that fast. But—first and last—it is made for work—consistent work—day in and day out work.

Remember, Paige owners don't have to make apologies or "offer excuses." Their cars are out of commission at one time only—when they are locked up in the garage at night.

And—best of all—you can readily establish these facts for yourself.

All that you need to do is get in touch with the nearest Paige dealer.

Let him prove his case. Let him introduce you to men who have invested their money in Paige cars. Listen to their experiences—ask for their honest opinions.

Then, you will know whether Paige cars are reliable under all circumstances.

Then you will know whether Paige cars are economical to maintain.

Then you will know whether Paige is the type of car that you have been looking for.

Do this—while the Dealer can still make immediate deliveries.

Linwood "Six-39" 5-passenger - - $1175 f. o. b. Detroit
Fairfield "Six-46" 7-passenger - - $1375 f. o. b. Detroit

Many Other Kinds of Fruits in Our Descriptive Catalogue

One man can cultivate 3 to 6 times the usual acreage with Planet Jr implements. They are so ingeniously designed and scientifically constructed that with greatest ease they do thorough, rapid cultivation. Fully guaranteed.

"I'd rather have my Planet Jr Seeder during the season than an extra man," writes one user.

No. 25 Planet Jr Combined Hill and Drill Seeder, Double and Single Wheel Hoe, Cultivator and Plow will work two acres of ground a day. It is a great tool for the family garden, onion grower, or large-scale gardener. Is a perfect seeder and combined double and single wheel hoe. Unbreakable steel frame.

We carry stock in Los Angeles. Agencies in all principal Pacific Coast cities.

New 72-page Catalog, free!

Illustrates Planet Jrs in action and describes over 70 tools, including Seeders, Wheel Hoes, Horse-Hoes, Harrows, Orchard- and Beet-Cultivators. *Write for it today!*

No. 17 Planet Jr is the highest type of single-wheel hoe made. Its light durable construction enables a man, woman, or boy to do the cultivation in a garden in the easiest, quickest and best way. We make 32 other styles of wheel hoes and seed drills —various prices.

"Caterpillar", which is so aptly descriptive of the appearance and motion of the track, was adopted as the Holt trade mark and registered in every civilized country.

The early Caterpillars were propelled by steam; then later it was Holt experience that designed, developed, and built the Caterpillar gasoline motor, thus producing a tractor incorporating a new traction principle and a combination of economical power and light weight. Soft, wet roads and soils, deep sand, and other difficult conditions could be traveled over without handicap, and the Caterpillar thus proved to be the correct solution of the problem which Benjamin Holt had set about to solve. Since then many thousands of these tractors have been built and put into service throughout this and many foreign countries; the name Caterpillar is familiar to farmers, contractors, and engineers everywhere.

The Caterpillar has played an important part in some of the biggest tractive jobs the world over. The Ashokan Reservoir in the Catskill Mountains is built on land that was cleared of trees and stumps by the Caterpillar. The famous Los Angeles Aqueduct was completed well within the estimated cost largely because 27 Caterpillars cut the cost of hauling material to one-third. Caterpillars are being used for freighting in Alaska at 40 degrees below zero and for hauling mahogany logs from the forests of South Africa. Millions of dollars worth of tungsten and copper ore are hauled from the mines by Caterpillar power. In the Pacific Northwest Caterpillars are removing the stumps from logged-off land that was considered practically worthless and making out of the land fruitful farms. Thousands of acres of swamp land in Florida and Louisiana have been reclaimed by means of the Caterpillar.

A recent addition to the Holt line is the Caterpillar Harvester, which requires no horses or tractor to propel it, traveling over the grain fields and cutting, threshing, cleaning and sacking the grain with the aid of only four or five men. This wonderful machine, Benjamin Holt's latest triumph, threshes and prepares for market as much grain as 600 men with scythes and flails could handle in the days of our grandfathers.

The Holt Manufacturing Company employs approximately 2000 men in its Stockton plant at the present time and in most of its departments runs three eight-hour shifts. It also has a big Eastern factory at Peoria, Illinois, and offices and warehouses in Spokane, Washington. Other offices are located at San Francisco, Los Angeles, New York City, Wichita, Kansas, and the company has representatives in other cities of the United States and all the principal foreign countries. Through the company's whole existence and to the fullest extent today, the dominating force of Benjamin Holt's personality has been the greatest single factor in the success of this great institution.

THE SOIL FACTOR IN FERTILIZATION

Written for California Cultivator
By H. C. Brewer

IN a recent issue of the Cultivator Mr. Kenneth MacRae disagrees with Dr. W. P. Kelly's warning "against the use of nitrate of soda for fertilizing purposes." He mentions his own success with nitrate in supporting his position and with no further justification, apparently, than that given by some time-worn statistics, he proceeds to an indictment of the work of the Riverside station. Mr. MacRae's sincerity in these matters is not questioned; he states, however, that as a consequence, "the orange grower is at a loss what to do or which to follow." The writer takes the opportunity to offer one or two suggestions in the hope that they will aid the grower not only in the judicious use of experimental results but also in the proper interpretation of statements made by the investigators in pointing out what he believes to be the important facts revealed by those results.

The exception proves the rule! Quite possible it is that Mr. MacRae can use nitrate with some degree of success on his orange groves, while for the large majority of farmers, it would be inadvisable to do so. A state-

PIPE

New and Second-hand Water Pipe and Casing

CASING AS FOLLOWS:

BETTER PRICES BROADER MARKETS

Part Played in Problem by Transporation — National Treament for a National Enterprise.

IN every part of the country the farmers are turning their attention to questions relating to the handling of their products after they leave the farm. Transportation is a part of this problem. The cost of reaching their markets and the ability to reach them promptly at the right time are important factors in determining the returns from their crops.

Low Freight Rates

Fortunately the American farmer has at his command the lowest freight rates in the world. It costs no more to move a load of wheat 500 miles by rail than it does to haul it five miles from farm to station by team. A ton of farm produce of any kind can travel almost twice as far for the same charge on American railroads as on the government-owned roads of other lands.

The cheapness of transportation is not the whole issue. To meet the needs of the farmer transportation facilities must be ample. There must be plenty of tracks and cars and locomotives and sufficient terminals.

Billion a Year Needed

The railroads are anxious to provide means to take care of all the business they can obtain. But a vast outlay of money is required. A billion and a quarter dollars a year for the next ten years or more must go into railroads to provide the necessary transportation facilities.

During the past few years it has become more and more difficult to obtain even in part, the money required for this purpose. This has been due partly to the poor promise of a satisfactory return on the investment; partly to the uncertainty created by numerous and conflicting regulations.

Regulate For All the People

Nobody seriously proposes that the public regulation of railroads shall be weakened. Certainly the railroads themselves do not. But it is a reasonable proposal that the regulation of this great national business should be handled by national agencies, on national lines, in the interest of all the people, and not by local agencies to serve local or sectional ends.

Regulation at cross purposes by 49 masters—48 states and the federal government—now imposes upon the railroads an annual burden of many millions of dollars of wasteful expense, from which the public derives no benefit. It is of primary importance to the farmer to cut down this waste in order that his products may be moved to market at the least expense and with the greatest possible expedition.

The farmer's interest demands free trade among the states.

ment like Dr. Kelly's would not be intended for so literal an application as to exclude occasional exceptions. Still, even in such cases it would seem better form to look beyond the practice of a single method before deciding that its results are the most desirable. Did Mr. MacRae ever use sulphate of ammonia, as suggested by Dr. Kelly, and can he assert that it would not have produced as good or better results?

Generally speaking, a neutral soil (one in which the bases and acids balance) provides the most favorable medium for plant growth, as in the cases of corn, oats, wheat, vetch, cowpea, cabbage, apple, orange, etc. Sometimes, plants accustomed by long years of propagation under somewhat unneutral conditions, seem to make their best efforts only under those conditions as instanced by some of the berries in acid soil and alfalfa in alkaline soil.

Many of the soils of this state, however, are quite basic in character, our "black alkali" sections being an extreme example. In them we find carbonate of soda concentrated to such a degree as to constitute an active antagonist to plant life. On the other hand, alkaline soils ordinarily are best adapted to the growth and multiplication of many organisms essential to the fundamental soil processes of good agriculture, i.e., the desirable organisms of decay; nitrifying bacteria and those organisms which aid in the fixation of amospheric nitrogen.

These facts should be taken into consideration in planning fertilization, for it would seem evident that if we avoid practices we know to be inadvisable in California, natural conditions will go far in helping us to raise larger and better crops. It is just at this point that Wagner's table of fertilizer values is apt to be most misleading. It is impossible to state a figure representing the ratio of effectiveness between, say, nitrate of soda and sulphate of ammonia on the heavy, often acid soils of Germany or of upper New York state, and expect it to hold true in California. Such an expression of comparative value does not hold true over a single state, and that is why few progressive farmers today accept it as being of any practical worth.

We lament with Mr. MacRae that "there is no absolutely proven fertilizing method." We never expect to see a method that will fit that bill of particulars. But, allowing for individual exceptions, which are readily recognized as such, Dr. Kelly points out a pretty definite road for Mr. MacRae's perplexed grower to follow.

Nitrate of soda increases the aklalinity of our soils and therefore their inability to produce crops. Do not use it! Check unhealthy soil conditions instead of developing them. Indeed, is it not possible to turn them to our advantage by a little study of the question? Consider the possibilities in the use of sulphate of ammonia. Test for test it constantly gives results of the highest character, but is not so widely known because heretofore it has been produced in limited quantities. The Berkeley station after an exhaustive series of tests states that it is the only quickly-available source of nitrogen readily nitrified by California soils, ranking with the highest in this regard. This is probably due to the fact mentioned previously that our soil conditions afford the means of easy and complete nitrification of sulphate of ammonia so that its plant food is made available about as fast as the plant can use it. The reactions which occur tend to produce a healthier balance of soil compounds which, under an efficient system of tillage, leads to the possibility of better yields and a larger variety of profitable crops.

The men of the experiment station are blazing the way for growers to follow. It is for us to apply the results of their investigations to local conditions just as far as common sense leads us to do so. We cannot expect them to shoulder the whole responsibility of determining the best methods for each of us to follow. We can accomplish a great deal more through a cheerful spirit of cooperation than by a weakness for indiscriminate knocking. Let us drop the spirit of "what was good enough for grandfather is good enough for me" and realize that Dr. Kelly and his coworkers are laboring only in the broadest interests of California agriculture.

Mr. Brown proved that blasting pays

This shows part of the 18-year-old orchard of George W. Brown of Mount Cory. Trees in row at left were planted in ordinary dug holes; those at right were planted in blasted beds.

The trees in blasted beds now average 25 feet high with trunk girths of 42 inches. Those not in blasted soil average 18 feet high with trunk girths of 27 inches.

Plant your fruit trees in beds blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

and *you* will find, as Experiment Stations have found, that "trees planted in blasted holes develop deeper and stronger root systems than trees planted in spade-dug holes," and will bear earlier and yield larger crops.

The two Giant Farm Powders are made especially to suit *western* farm and orchard conditions. They pulverize the soil instead of packing it. Ask your dealer for either of them—Giant Stumping or Eureka Stumping Powder—and for other Giant blasting supplies. Be sure to get the genuine, bearing the Giant brand. If your dealer has only ordinary dynamites, we will see that you are supplied with the real Giant Powders.

Frost Protection in Citrus Groves

By Prof. R. S. Vaile

Continued from Last Week

Effect of Average Yield

The average yield of the orchard affects this problem in a marked degree as brought out in Table VI.

TABLE VI.

Relation between yield and risk, figured in per cent of total crop lost.

Field Boxes Lost	Total Crop in Field Boxes 300	400	500	600	700	800	900	1000
30	10.	7.5	6.	5.	4.3	3.7	3.3	3.
35	11.7	8.7	7.	5.8	5.	4.4	3.9	3.5
45	15.	10.1	9.	7.5	6.4	5.6	5.	4.5
55	18.3	13.7	11.	9.1	7.8	6.7	6.1	5.5
65	21.7	16.2	13.	10.9	9.3	8.1	7.2	6.5

In other words, if the crop averages 900 field boxes per acre, losses equalling one total crop in 20 years will justify equipping and firing an average of ten hours lightly and five hours moderately, every season, while if the average crop is only 300 boxes, a saving of one crop in every seven will be necessary to justify the same expenditure. Whenever the average yield is high and the average risk also rather large, then certainly protection is amply justified. For instance, if the average yield is 900 field boxes per acre and the average annual loss is ten per cent of the crop or a full crop every ten years, that average loss will be 90 field boxes per acre. At one dollar per field box that would mean $90 per acre per year. Ninety dollars per acre per year would justify a great deal of smudging as may be seen by referring again to Table III. Or if only a moderate firing is required to save that ten per cent of the crop, say, for instance, the ten hours light firing and five hours moderate firing each season referred to above, one would be making 100 per cent on the investment, while if the risk was increased to one crop every five years, and still the average yield was held at 900 field boxes, the profit from protection against frost would again be doubled.

Handling the Equipment

Some, of course, will say that this discussion of the economics of the situation has been entirely theoretical, and that it is impossible with the present equipment to accomplish the results claimed. The writer is convinced from his experience and observation that it is entirely possible to handle the frost situation in orange groves of all parts of Southern California with the equipment outlined and at the expenses suggested, provided proper judgment and thoroughness are used. Smudging is one thing that can not be half way done with half way results. It must be done thoroughly or not done at all. This year the cold weather coming November 13 caught many unprepared. One large orchardist told the writer that it has always been his experience that there are three consecutive cold nights, the first of which is not the worst. At the time of the November cold he had oil enough for only two nights so the first night he did not light. It so happened that the first night was the one cold one of the series and he lost considerable fruit even though he saved his oil.

In the first place, in considering the matter of how to handle a frost protection equipment one must have some idea of the temperature at which to light. This question is influenced very largely by conditions. It is of interest, however, to note that oranges—and remember that this discussion applies to oranges entirely, not to lemons—oranges will not freeze until they reach at least 28 degrees Fahrenheit. In other words, the temperature of the orange itself must drop to 28 degrees, or possibly an extreme minimum of about 27½ degrees. This would possibly indicate a very simple rule for lighting, namely whenever the air temperature reaches 28 degrees the fires should be lighted sufficiently to keep the air temperature from going lower. As a matter of fact, such a practice would be wasteful of considerable oil, so that it would be necessary in such cases to have the temperature readings of the fruit hanging on typical trees in the cold parts of the grove, in addition to having the air temperature readings, because the orange temperature may vary in relation to the air temperature through rather wide margins because of several factors. Some of the factors which enter into a comparison of the temperature of the orange and the present air temperature are first the temperature during the preceding day, which in a large measure will govern the amount of fall that must be experienced before the orange reaches 28 degrees, and second the relative humidity. The humidity is of importance because if it is high there is a certain amount of moisture collecting on the outside of the fruit which immediately changes over to ice, and in the process a certain amount of heat is liberated. The liberation of this heat tends to retard the radiation of the stored up heat of the orange and thus prevents as rapid a drop of the temperature of the orange as might otherwise be expected. The Ontario Protective Association has come to adopt a rather general policy with oranges, of never lighting until either the temperature has fallen below 28 degrees or else has held at 28 degrees for at least three hours. This seems to be a fairly safe rule. Of course, there are occasions when a very rapid dropping occurs in the outside temperature, and if the orange temperature has already reached the danger mark when one of these drops commences, it might take a fairly large force of men to light heaters rapidly enough to prevent damage. However, with the present organization of most of our communities, it would seem safe to take this small amount of risk.

The experience of growers generally seems to indicate that two men are required for each ten acres of a grove to be protected during the time of actual operation. There are a few groves where a large amount of labor is kept on hand just because of the possibility of a very rapid drop in the temperature, and there are also a few where a larger acreage is handled by one man. However, the answers to inquiries sent out indicate that by far the commonest system is two men to ten acres.

During the nights of December 25 and 26 the writer made certain observations in the Pomona and Ontario districts regarding the methods used in the burning of heaters. Numerous instances were found where merely the outside rows of heaters along the north and east sides of the groves were lighted. Temperatures taken at intervals throughout the nights in such groves indicate that the actual temperature effect of such lighting was practically negligible for the orchard as a whole. That was certainly true of those groves in the extreme northern part of the district where other groves were unprotected. The smoke from the heaters seems to carry with it no active heat units and seems also to be of low efficiency in preventing radiation. For instance, on the night of December 25 a drift of air carried a heavy smudge from the Pomona-La Verne section over towards San Dimas. This smudge became so thick just east of San Dimas that one could hardly see to travel in an automobile. During the time that the smudge held over that portion of San Dimas no change could be noticed in the temperature as effected by the smudge.

Continued Next Week

Care should be taken to handle alfalfa hay so as not to lose leaves, as these contain considerably more than 50 per cent of the feeding value of the hay.

Associated Growers First Season Assured of Success

THE California Associated Olive Growers, Incorporated, are now marketing their first crop of olives under the growers' brand "SERRA".

A more favorable year than 1916 could not have been selected by the growers in launching the association. The condition of the market is such that the demand for California Ripe Olives is greater than the supply and the association therefore finds itself in this admirable position in marketing its pack. Under such conditions the chief advantages to the grower lie in the fact that he is assured of moving expeditiously and at satisfactory prices all of his pack.

The grower in this association is really in business for himself, standing his profits and losses as they may be; his money goes into the pickling, processing, canning and selling of the olives. It is very satisfying indeed to know that after making such investment good and substantial returns are in sight.

The short market of 1916-1917, as it were, has the added advantage of permitting the management of this business to select its outlets this year with a view of proper distribution of of this season's pack and particularly in such a manner that it will provide adequate outlets for the greatly increased pack of the growers in 1917, for all indications at the present time, from growers constantly becoming members of this association, point to the fact that the 1917 pack of the association will be at least three times as large as the present season of 1916, barring weather conditions beyond our control. However, provisions are now being made by the management to provide facilities accordingly.

The association pack of 1916-1917 is approximately 250 tons.

It is desired particularly to point out at this time that notwithstanding the market conditions of California ripe olives no undue advantage has been taken by the association of such conditions in raising prices. The association desires to increase the demand for California ripe olives and prohibitive prices tend to curtail consumption by the great masses whom it is particularly desired to reach in this business.

Taken as a whole the business of the California Associated Olive Growers for the season of 1916-1917 will be a success, and the old adage applies here that "nothing succeeds like success," and the growers are very keen to take note whether or not an institution is successful and be governed accordingly in casting their lot.

STANISLAUS FIG GROWERS PERFECT ASSOCIATION

The fig growers of Stanislaus County met at Ceres Hall on March 2. The committee appointed at the former meeting reported in favor of a permanent organization of all fig growers of Stanislaus County and vicinity. Amos Hiatt was elected president, Charles Sanders vice president, J. W. Buck secretary-treasurer, and George Cross and A. D. Green members of the executive committee. A constitution was submitted and accepted. The association voted that we advise fig growers not to sell for less than five cents for culls and 12½ cents for good figs. The association also voted to advise growers not to contract before the regular meeting of this association to be held in Ceres Hall Saturday, April 7, at 2 p. m. At that meeting the marketing and selling price of figs 1917 will be discussed.—Amos Hiatt, president; J. W. Buck, secretary.

Patronize reliable seed firms, those that have a reputation for honest dealing. Look over the list mentioned in the advertising columns of this paper. Send and get catalogues and compare prices and secure samples of seeds. Examine samples for impurities and, make a germination test to see if they will grow.

Select the tried and tested varieties of seed, those known to be adapted to your locality. It is well to experiment with the new things but for the main crop dependence should be placed on the varieties that have been proven by years of experience.

JOHN DEERE IMPLEMENTS

BETTER FARM IMPLEMENTS AND HOW TO USE THEM

BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-111.

JOHN DEERE, MOLINE, ILL.

John Deere Spreader

The Spreader with the Beater on the Axle

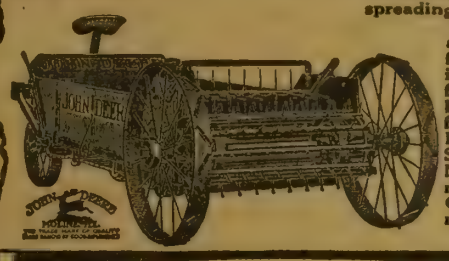
Mounting the beater on the axle simplified the construction, eliminated troublesome parts and made possible a successful low-down spreader with big drive wheels. There are no shafts to get out of line, no chains to cause trouble, and no clutches to adjust. The only spreader with beater and beater drive mounted on axle.

Low down, with big drive wheels out of the way. Easy to load.

Revolving rake, driven by manure moving toward the beater—no bunching of manure. Ball bearing eccentric apron-drive—a new and exclusive driving device.

Makes uniform spreading certain.

Wide spread attachment for spreading seven feet wide can be furnished for the John Deere Spreader. No chains nor gears. Quickly removed.



John Deere Plows for Light Tractors

So far as quality of John Deere Plows for Light Tractors is concerned, they are built for the farmer who realizes that it is business judgment to buy a high grade tractor plow. Don't forget that a tractor plow is not an everyday purchase.

John Deere Plows for Light Tractors are noted for their high grade work in the field—the real test of tractor plow value.

Before you make your purchase, be sure to see John Deere Plows for Light Tractors. A careful purchase means a permanent saving.

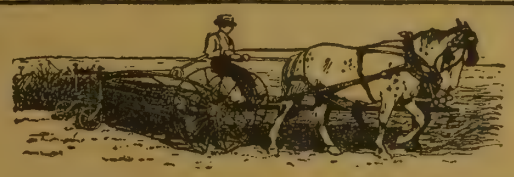
The John Deere Light Tractor Disc Plow works with any standard tractor—the hitch is adjustable.

Three or four discs.

Discs have a double setting. Taking care of all conditions where a disc plow can be expected to operate.

Adjustable scrapers keep discs clean and lighten the draft.

No choking in trashy ground—frame is high, beams are dropped, which gives good clearance under the frame, and there is plenty of room between the discs for trash to pass through.



The John Deere-Dain System Rake

Here is what you do with the Dain System Rake:

Follow the mower closely, rake while leaves are still active and place hay upon clean stubble.

Make straight windrows, and no dumping of rake is required. There is no bunching of hay in turning corners.

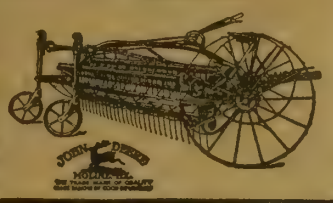
Put the hay in medium size windrows, with the bulk of the leaves inside and the majority of stems outside.

The windrows will be loose in the center for the free circulation of air. The hay retains its color and nutrition.

The John Deere-Dain System is the rake employed with the Dain System of Air-Curing Hay.

Reel raised or lowered, rake thrown in or out of gear and angle of teeth changed by means of convenient levers.

Ample capacity. The inclined frame grows higher where the windrow becomes larger—an exclusive Dain feature.



John Deere Syracuse Plows

Syracuse Plows have an enviable field record among farmers in chilled or combination plow territory

Here is a feature that is appreciated by the man who buys a Syracuse Plow. Extras ordered will be duplicates of the original parts. Bolt holes will be in the right place. Every part will fit. In fact all necessary parts that go into a Syracuse Plow could be ordered as repairs and when received built into a complete plow. Extra parts are exact duplicates—no trouble results.

Remember, Syracuse quality is uniform.

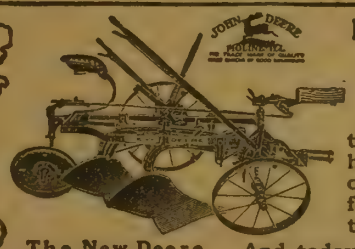
John Deere-Syracuse Sloping Landside Chilled Plows are unsurpassed for general purpose work in light soils. They leave a clean, open furrow bottom.

Share and shin piece combined—a fresh, clean cutting edge obtained with each new share.

Index or set-over style of beam—easily shifted to give the plow more or less land.

Equipped with Syracuse Chilled Moldboards—noted for satisfactory scouring qualities, strength and uniformity. Right and left hand styles.

John Deere-Syracuse Sloping Landside Chilled Plow



New Deere Light Draft Gang Plow

The New Deere Gang is the most widely used plow of its type.

It is light draft, durable and is equipped with John Deere bottoms, known all over the world for superior work, easy scouring and light pulling qualities. It cuts and turns full width of furrow.

A simple, practical foot lift and auxiliary hand lift lever—easy to raise bottoms out of the ground.

John Deere Quick Detachable Shares—great labor and time savers. Share can be taken off easily, only one nut to remove.

For twenty years the New Deere Gang has had the good opinion of enough farmers to make it the one best seller—

And, today, it is the same plow it was twenty years ago, with the usual minor refinements added.

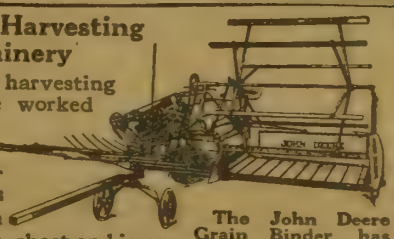
Correct in design, always representing the highest development of the plow-maker's art, the New Deere Gang is a leader, and has been every single year for twenty years.

Go to your John Deere dealer's and look this plow over—you will readily see why it is such a popular plow.

John Deere Harvesting Machinery

John Deere harvesting machines have worked under every possible condition—severe droughts that resulted in much light grain, short and irregular straw—extremely wet seasons, heavy grain, down and tangled.

However, the John Deere, "The Better Binder", has throughout maintained an unbroken record of success in cutting, binding and tying grain.



The John Deere Grain Binder has wide and high bull wheel—great power.

Main frame riveted—unusually strong.

Three packers instead of two, make better shaped bundles and save grain.

Accurate tying mechanism.

Quick turn tongue truck saves time, relieves horses and makes square corners and full swaths possible.

JOHN DEERE, MOLINE, ILLINOIS

Montelena Herd
OF
Large Yorkshires

We have left some choice service boars, a few fall pigs of both sexes, and future prize winners in spring pigs for your inspection.

Santa Anita Rancho
Anoakia Breeding Farm

ARABIAN-THOROUGHBREDS: Two-year-olds, sired by imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

Correspondence Invited

W. H. TAYLOR, Superintendent **Santa Anita, Cal.**

BILLIKEN HERD OF
Chester Whites

The individuals in this herd possess the best blood and type the breed produces. Headed by Billiken, who's sire, Wm. A., was grand champion at the 1916 National Swine Show at Omaha. Assisted by Missouri Lad, the 1916 California State Fair grand champion and by Ventura, a son of Missouri Lad and Chief Modeler, from the famous Lenora family. All the brood sows are the very best it is possible to produce. Open and bred gilts and sows. Service boars, pigs of both sexes and all ages. Everything cholera immune and registered free. Whether you want Show or Utility type I can supply you at very reasonable prices. Write for circular, booklet and special description.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dark Yolks

I have a flock of 400 White Leghorns. A few of them are laying eggs with a very dark yelk, some slightly tinged with green. The hens are running at large on an alfalfa field and have liberty to scratch in manure from barn; have clean water from automatic fountains. Their daily feed is two-thirds wheat, one-third gyp corn twice a day, all they will eat up clean in ten minutes. Mash: 60 pounds bran, 20 pounds ground barley, three pounds meat scrap, three pounds charcoal, two pounds oil cake meal, kept by them all the time. Five gallons of sour milk daily. Hens are laying well.—Subscriber, Tancred.

Your ration is excellent, and the fact that the hens are healthy and laying well shows that there is nothing seriously wrong anywhere. It is the alfalfa that makes the yolk that dark color. Perhaps they are not getting quite enough grit or sufficient exercise to digest all they eat. A dose of Epsom salts all round is a good thing in the spring when the hens' livers are apt to be clogged from heavy feeding or confinement. Mix half a teaspoon of salts for each hen you wish to dose in a little wet mash, and give this once a week for three or four weeks. I think you will find that with this little cleaning out of the digestive tract and the coming of sunnier weather the green tinge in the yolks will soon disappear.—J. A. K.

Reviving Apple Orchard

Please give instructions for pruning an old neglected apple orchard and what to apply to bodies and limbs where they are sunburned and wormeaten. Would it be advisable to cut off all the water sprouts or leave some of them? Would you recommend cutting the ends of the limbs or do most of the cutting near the bodies? How may the borers be kept away?—Subscriber, Porterville.

It is very difficult to prescribe treatment for an orchard in this condition. Once the borers have made their home within the trunk of the tree a wire inserted in the burrows is about the only means of destroying them. The best treatment is prevention, giving the trees sufficient protection to prevent them becoming sunburnt. Prevent further sunburn by whitewashing. We would cut the tree as severely as possible to induce young wood growth. Assuming there may be some San Jose scale on the trees it would be beneficial to spray with commercial lime sulphur solution, one part to nine of water, applied at once. Where the trunk has become decayed it will be well to chisel away all the decay and dead part and fill with cement, or rather a concrete of cement and sand. Where large cuts on the branches are made it will be well to protect with a paint of asphalt or grafting wax. The subscriber does not say how seriously these trees are affected, but we assume enough so that it may be a question as to the wisdom of trying to renew the orchard. Of course if the varieties of apples are adapted to the section and the trees are heavy bearers it may pay. Otherwise remove and plant new.

Powdery Mildew

Have a small apple orchard of about 50 trees which are affected with powdery mildew. Please advise what kind of spray to use and when.—Subscriber, Ono.

If the buds are not already opening spray at once, or before the end of March, with full strength Bordeaux, 5-5-50. Later when the trees are partially leafed out, use the weaker Bordeaux, 3-5-50. It is also well to remove the mildewed tips during the winter season. The lime-sulphur wash is also excellent and has the advantage of being an insecticide as well. If there are San Jose scale on the

W. J. BEMMERLY, Woodland, Cal.

branches one might well use lime-sulphur wash at the rate of one gallon commercial lime-sulphur solution to nine gallons of water. W. S. Ballard of the United States department of agriculture and Commissioner Volck of Santa Cruz County worked together on the powdery mildew problem for several years and recommended, where it was desired to control not only powdery mildew but various insects such as aphis, codling moth, etc., the following: Iron sulphide (commercial), 6 pounds, neutral lead arsenate, 20 pounds, "Black Leaf 40" one pound, water 200 gallons. A second spraying to be given a couple of weeks after the first and a third with the same solution about three weeks after the second. As to time of spraying the locality must determine. In the warmer valleys buds are already opening while near the coast they may not open for perhaps a month yet.

Cover Crop to Conserve Leaves

Will you or some of your subscribers assist me in deciding upon what cover crop would be the most efficient to plant so as to get enough growth on the ground by the end of this year to catch and hold the most of the leaf crop in my apricot and walnut orchard. The soil is a light sand, drifts very easily and does not naturally grow much of a crop of weeds, and, so far, with clean culture I have never been able to retain any leaf mould for the fall and winter winds have always blown most of the leaf crop away into the nearest creek. What I am planning to do is to thoroughly irrigate the orchard in August (after harvesting the apricot crop), and sow the irrigating furrows to barley, allowing of course any natural growth, such as burr clover, alfillaria, etc., to grow as they please. I am convinced that many orchardists do not attach sufficient importance to the retention of their crop of leaves, and therefore do not make any effort to save them, but I have for years. Notice that my biggest and most productive trees are those on the outside where against the fencing and weeds the drifting leaves have season after season accumulated when they have not been blown completely away. Any suggestions that you can offer me towards this end will be gratefully accepted. —Subscriber, Moorpark.

We will be glad to hear from subscribers on this point, but it hardly seems practicable to have cover crop growing in walnut orchard to catch the leaves which fall, as that is harvest period as well and growth under trees would interfere. With apricots it would be entirely practicable. Still more, the inquirer could get results with buckwheat of which he might grow several crops during the summer.

Crooked Breast Bones

What causes crooked breast in turgeys? Have had much of this trouble and want to eliminate it.—Subscriber, Ceres.

Crooked breast bones in both chickens and turkeys are apt to be congenital. That is, if you have a crooked-breasted bird among the breeders you will find crooked breasts among the offspring. Continued breeding from such birds will soon produce a crooked-breasted flock. The cause of the first crooked breast bone may have been lack of ground bone or other bone making material in the ration. Soft bones bend easily, and a little crowding in the nest before the poults begin to roost will easily bend a too-soft breast bone. This season see that every breeder has a straight breast bone even if you have to discard some otherwise perfect specimen, and then see that the poults have rolled oats from the first, ground bone as soon as they are old enough for a mash, and plenty of exercise all the time.—J. A. K.

Planting Beans

Will you kindly publish the number of pounds per acre to plant of Tepary and Henderson bush beans?—Subscriber, Chatsworth.

Plant 20 pounds of Tepary and 25 of the bush beans per acre.

Feed For Layers

Where may I obtain information as to feeding a few hens for laying? Amounts are generally given in such large quantities that it is hard to re-

The Supreme Tractor for Cultivating

The Bean TrackPULL SIX HORSE Tractor is the Ideal Machine for Cultivating

Cultivating time is here and every farmer and grower should know about the many advantages of using a Bean TrackPULL Tractor.

The Bean TrackPULL is very light, weighing only 2875 pounds. It pulls itself over soft soil and does not sink in nor does it pack the soil.

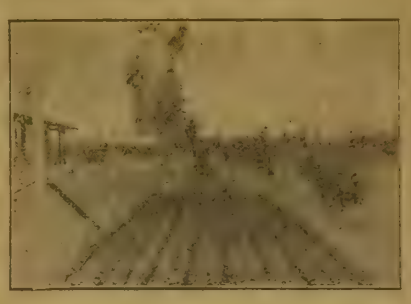
How it Works

The Bean TrackPULL Tractor is built on a substantial track 12 inches by 32 inches on the ground. The power in the tractor pulls it along its own revolving track. That's why it does not pack the soil — gets long traction — turns easily to right or left—can make a complete turn in a 10-ft. circle, is most economical in operation and a boy can easily work it. When the hot days come your team loafs and you get only an average half day's work done in 10 hours. The Bean TrackPULL will work day and night if you want it to and does the work all day long that a six-horse team could do if they worked hard continually.

The Price is Only $975.00

Bean TrackPULL Tractor construction consists of a 10 H. P. (at belt) Le Roi 4-cylinder vertical type—4-cycle motor. Equipped with Donaldson air clarifier, Bosch ignition, Perfex radiator, water cooled with centrifugal pump and fan, combination splash and pump lubrication, Hyatt roller bearings in track wheel sprocket and track rollers, six New Departure ball bearings in the transmission, running in grease and dust-proof. Gears are steel. No differential or other complicated mechanism.

Making Figure 8 around trees and leaving no unfinished work.



Pulling a spring track cultivator between rows 12½ feet apart.

Prompt Deliveries in April

Our entire output is sold a month in advance and we are working night and day. We are building a large addition to our factory to increase our capacity so that we will be able to ship tractors that are ordered now, in April.

Corning Chamber of Commerce

Invites you to investigate

Corning and Vicinity

the best known Colony Town in the Sacramento Valley—successful and well developed subdivisions—land in any amount to suit purchasers on extremely fair terms.

The OLIVE, ALMOND and ORANGE are successfully grown here, together with the Prune, Apricot and other California fruits. Olive and Almond land is well worth your investment. Prices are not inflated, and good soil may still be had at comparatively low prices. General farm lands equally desirable and reasonable.

Make the trip on the State Highway, come and see for yourself a well ordered and highly developed Colony community. You will find comfortable hotel and commodious garages, as well as the pioneer free camping ground for tourists. Good schools, banks, business houses and a clean town and community—the home of the H. J. Heinz Co. "57 variety" Olive Plant and the Maywood Packing Co., the producer of the "Jumbo" ripe pickled olive. Corning ripe pickled olives are the standard of excellence. We believe an investment here will appeal to you. Take the West Side State Highway.

duce to proper amount for half dozen or dozen hens.—Subscriber, Los Angeles.

Valuable bulletins on feeding may be had from the Oregon experiment station at Corvallis, Oregon, the Cornell station, Ithaca, New York, Purdue University, at Lafayette, Indiana, the Missouri station, Mountain Grove, and many others, but there is nothing more comprehensive than Professor Jaffa's bulletin on "Poultry Feeding", published at Berkeley. A formula that corresponds in general with those of Professor Jaffa, but is better suited for a few hens, is: Bran two parts, ground oats or ground barley one quart, middlings one quart, alfalfa meal, one quart, beef scrap or fish scrap one quart. In cold weather a quart of corn meal might be added, and occasionally a portion of the beef scrap might be replaced by fine ground bone. This is my own formula and has been very satisfactory. When a very high protein content is desired one-half quart of soy bean meal or linseed meal might be added, or the formula might read; one-half part each of beef scrap and the vegetable meal. Many feeders add salt or charcoal or both to these formulas, but I could never see the need of either. There is no "best" formula, and no occasion for a complex ration. Just remember that with a mixture of three or four different ground grains, of which bran is the most important, as a basis, and about one-sixteenth animal protein, you can do almost anything you wish to do. Some feeders find a mixture of bran, feed meal, middlings and beef scrap sufficient, but in our climate ground oats and barley meal are both to be preferred for regular use to the corn meal. Variety and a reasonable balance are the main things.—J. A. K.

Extending Silo

Have purchased a resaw silo 14 feet wide by 20 feet high which I intend to move. I wish to make it deeper. Will you advise which would be the best method, to go down with concrete, say six feet in the ground, or extend the top? Also, what color should good corn silage be and is it customary to use salt in making corn silage?—Subscriber.

We think it would be much safer to make a solid foundation rather than to extend this silo from the top. If soil conditions are right so there is good drainage the six feet pit would be much the cheaper. If this could not be done then we would build from the top. The color of corn silage should be a rich brown, say a walnut shade. Salt adds nothing to the value of the silage and we believe is not generally used.

Cows Bloating on Burr Clover

I have a Jersey cow due to freshen in June which I have been pasturing on burr clover. She is fond of the clover but it causes her to bloat. Is there a preventive of this and will there be less trouble when the clover is more mature?—Subscriber, North Glendale.

There is great difference in cows in this matter of bloating and where one is so susceptible as this one appears to be it will be wise to watch closely and not let her get to the lush young feed until all moisture is dried off in the morning. Again, it might be well to leave on the pasture but a short time, making part of the ration dry alfalfa hay. When the clover becomes more mature the danger will not be so great. In the meantime, where one can do so it would be wise to cut and wilt or partially cure the clover, in which state it would not be so apt to cause the trouble.

Bulletins on Bees

Please advise if the California experiment stations have published any bulletins on bees. If so, how may they be obtained?—Subscriber, Visalia.

Bulletins published by the California experiment station are: Bulletin 274, "The Honey Bee as an Agent in Prune Pollination", by Hendrickson; No. 217, "Honey Plants of California", Richter; Cir. 63, "How to Make an Observation Hive", Nickels. It is possible that other bulletins may be had by addressing Agricultural Experiment Station, College of Agriculture, Berkeley. The United States department of agriculture, Washington, D. C., has issued several bulletins, among them, "Rearing of Queen Bees", "Comb Honey", "Cause of European Foul Brood", "Bees", "Bee Diseases", "Temperature of the Bee Colony".

Salting Ewes

A subscriber wished information as to whether salt should be withheld from ewes for a short period prior to lambing. He had been informed that some believed the feeding of salt might cause abortion. The question was referred to Dr. Hayes, veterinarian of the university farm school at Davis, who writes:

"We know that there is a popular idea abroad that salt given to pregnant ewes may cause abortion, but we do not know why salt should cause this effect, unless the ewes eat so much of it that diarrhoea is produced. This irritation of the bowels on account of too much salt, may sometimes act reflexly on the womb. Such conditions are rare however, and otherwise salt has no effect on pregnant ewes.

Cleaning Shells

Please advise what will remove the rough lime coating from abalone shells?—Subscriber, Hinckley.

Muriatic acid will take off the rough deposit from these shells. It should be applied with care, and unless watched closely the process may result in eating holes in the shell. After the lime formation is removed the shells should be polished.

THE "GREENING" OF POTATOES

GREENING potatoes means causing them to sprout under certain proper conditions just before you are ready to plant them.

There are two principal reasons for "greening" potatoes:

First. It makes the plant grow faster and mature more quickly, so that your potatoes can reach the market earlier.

This is a very important item to you, not only if you are raising some of the early varieties, but also if you are growing one of the late varieties. With the early varieties your natural desire is to plant and harvest as early in the season as possible, for the earliest potatoes bring the best price on the market. Yet if you plant very

Nitrate of Soda

California soils need available nitrogen. Get it as cheap as you can. Write us for "Cost of Available Nitrogen."

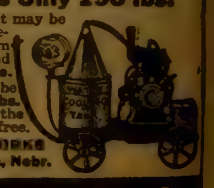
Light Weight Cushman Engines

Built light, built right—for farmers who want an engine to do **many jobs in many places,** instead of one job in one place. Easy to move around. Very steady and quiet—no jumping, no loud or violent explosions, but smooth running. **Throttle Governed,** Schebler Carburetor. Friction clutch pulley. Runs at any speed.

4 H. P. Weighs Only 190 lbs.

Mounted on light truck, it may be pulled around by hand. Besides doing all regular farm work, it is the original and successful **Binder engine.** Saves a team and **saves the crop. 8 H. P. only 320 lbs. Not cheap** but cheap in the long run. Engine Book free.



CUSHMAN MOTOR WORKS
804 N. 21st St., Lincoln, Nebr.

For All Farm Work
4 to 20 H.P.

early in the season, you always run the risk of having your plants damaged by late frosts. Now if, by greening, you can make it possible to plant your potatoes later in the spring, thus escaping the danger of frost, and still put your potatoes on the market as soon as the ungreened potatoes which were planted two or three weeks earlier, you can see that you will have gained a big advantage. You will have all the advantages of early potatoes without the risk.

Moreover, your late potatoes can be badly damaged by early frosts in the fall, and greening operates to save them from this danger also. It hurries forward their development so that danger from early freezing is greatly lessened.

Second. It makes the plant stronger, healthier and more vigorous. The increase of yield due to the planting of greened potatoes has been shown to be from ten to 40 per cent. That is certainly worth going after.

Now as to the method of doing it.

The best way for you to do is to spread them out on the floor of the granary, tool shed or barn. It would be preferable to put the potatoes on an old bed spring, or on something else that would allow a circulation of air underneath them. They should not under any circumstances be piled more than a foot deep, and it will be better if you do not have them more than six inches. The light on the potatoes should come from the east or north, for the south or west light is too strong for good results. You should keep the temperature between 60 and 70 degrees Fahrenheit if possible, and if there is any danger of frost, the potatoes should be covered for the night with gunny sacks, straw, or something else that will protect them. It will take from two to three weeks to green them, the time varying according to the light, warmth, etc. The progress of the greening can be ascertained by the growth of the sprouts, which should be allowed to grow not more than a half inch in length, and which should be full of buds. If the sprouts do not grow well, it indicates that there is not enough light. If the potatoes are properly greened, the sprouts will be tough enough to withstand ordinary usage, although if they were to sprout in a warm, dark cellar, the sprouts would be very brittle, and would break off very easily.

To summarize—you will better the condition and yield of your potatoes if you green them, and moreover you will have your potatoes, both the early and late varieties, maturing earlier. You cannot afford not to green your seed.—Grubb and Guilford.

COVER CROP EXPERIMENTS IN ARIZONA

A number of different cover crops are being grown on the Salt River Valley, Arizona, experiment station to get comparative data as to values. Garbanzo peas are making a very good showing, covering the ground nicely, with a good even stand, and at this time (March 1) are eight inches high or more. Canada field peas, although a cold climate crop, are making a nice growth and promise a good tonnage of hay or green fodder or an immense growth to turn under. Colorado stock peas are also being grown, and to an observer there is no difference between them and the Canada peas. A variety of vetch, the Black Purple, which has succeeded well in Southern California, has made almost no growth at all. Button clover, a much boasted crop in some of the Southern states, made so little growth that it was plowed up.

The field of Peruvian alfalfa sown in the fall of 1915 is making a splendid showing and is at this time as pretty and even a field as one would care to see anywhere.

LETTUCE FOR SALT RIVER VALLEY

Lettuce is being experimented with at the Salt River Valley, Arizona, experiment station to a considerable extent. Fifty-six varieties and strains of lettuce are being grown, most of these made a fairly good stand, but two varieties seem now to be better adapted to growing lettuce for market than any other of those tried. These are the New York or Wonderful, which is sometimes called the Los Angeles, with the Iceberg a close second.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

More tourists are enjoying California's roads this year than ever before in its history. It is said there are now more than 100,000 people of wealth visiting the state from east of the Rockies, and it is just such roads and such scenes as are depicted on this week's cover which draw many of these people. These good roads are, we believe, next to our scenery, one of our greatest assets. As to their value in facilitating movement of crops and of supplies required in the production of crops we have spoken often.

This particular scene is in Napa County, one of the smaller and one of the richer counties of the state. Perhaps one of the most striking features in this county are the great white oaks. The sunset glow adds to the attractiveness, and we hope we may be able to add a touch of color to our covers several times during the coming year.

SIXTH DISTRICT FAIR

The time was when California had a representative agricultural fair in Los Angeles, that is, representative so far as fairs of ten or 20 years ago were generally of agricultural interests. It must be admitted that the ponies had much to do with the principal features of those fairs. Later there was an effort to make a real estate speculative scheme out of the fair grounds, but they were saved and made a beauty spot within the city limits of Los Angeles. Now the management says these lands will be returned to their original use and made the site of a general agricultural fair with as little attention as possible to side shows and "attractions" of all types.

Mr. Davison and others of the management assert that it is to be an all-round agricultural fair, and as there has been a desire on the part of some to hold in Los Angeles this year a great live stock show similar to the International at Chicago, it is a safe guess that live stock interests will be given particular attention.

The exact date is not yet named, but it will be in late October or early November. Committees having to do with every feature of the fair have been named and with characteristic energy work has already begun. As usual Los Angeles is going to do things differently, and instead of the usual three to six days fair a suggestion at least has been made that this fair cover a period of practically 30 days.

CALIFORNIA

The Cultivator has no ambition to be a promotion paper devoted to description of our glorious scenery and our wonderful agricultural possibilities; its mission is cultural. Still, there is often material gain in standing off and looking at ourselves to see what has been accomplished and what we hope to do. To that end, especially with regard to the live stock interests, the Cultivator's field men have made surveys of Yolo, Napa, San Joaquin, Stanislaus, Kings and Tulare Counties and Southern California. We mention this lest, looking over this issue, one might ask as to the live stock industry,—which does not receive as much attention in this number,—for it is devoted to other things agricultural and horticultural in all of the northern and central sections.

We will not enlarge upon it in this place but refer our readers to Mr. Egilbert's excellent article on Page 307 and to Mr. Holman's on Page 311. Mr. Holman is the regular northern representative of the Cultivator with headquarters at San Francisco, and to him is due credit for much of the valuable material in this issue.

We have often said that some of the best reading of the farm papers is in the advertising columns, and in addition to that most interesting matter we give descriptive material of some of the large concerns which have their headquarters in the northern portions of California and make the things which enable farmers to produce more and better in California than in any other state in the Union.

We believe these issues of the Cultivator enlarging upon the great ess of our state are of material aid to its upbuilding.

CHAMBER OF AGRICULTURE

The commercial interests of the United States, through chambers of commerce, boards of trade and other bodies, have had for many years a national organization known as the National Chamber of Commerce. Some two years ago suggestion was made that various organizations of farmers should form a similar body which should have a national influence on things agricultural. There are today many powerful state and even national organizations, but these have lacked facility in working together when unity of action was required.

Regarding this condition Editor Meredith of "Successful Farming" says: "A group of farmers or certain individual farmers widely scattered over the country become interested in marketing, they hold meetings, write a few letters to congressmen, etc., to create sentiment for the particular matter in which they are interested; another group of farmers become interested in the good roads question and they hold meetings, pass resolutions, discuss the matter, but do not connect up with the farmers who are interested in marketing. Still another organization of farmers, centering their attention on the question of good seed corn, hold corn shows, urge the testing of seed corn, form purebred corn clubs, but they in turn have no contact with the organized good roads farmers nor those interested in marketing. Still another group of farmers become interested in pure bred livestock, form their associations, hold their shows, attend the state fairs, etc., but have no working arrangement with any of the other groups. In other words each interest confines itself wholly to its one particular line of work, gets no cooperation from the others, and for this reason has but little influence in making itself felt in state legislatures or in the national congress. Why cannot these farming groups get together and each take an active, cooperative interest in groups other than the one in which they are directly concerned and thus lend their support in getting such state or national legislation as might promote their common interests?

HIGH COSTS

State Statistician Robertson writes us that in his estimation neither the war nor large exports are entirely to blame for high cost of all products, that is, figures giving exports for the year 1914-1915, and 1916 show a decrease rather than an increase. In 1914 we exported of wheat 173,000,000 bushels; in 1915, 205,000,000 bushels; but in 1916 the exports were only 154,000,000. Sugar on the contrary showed a material increase, as did beans, but with wheat, as with corn, oats and all the cereals, decreased production for the three years shows explanation for the higher costs. In 1914 this country produced 891,000,000 bushels of wheat; in 1915, 1,025,000,000 bushels; in 1916, only 639,000,000. A similar decrease is shown in the other cereals and in potatoes, production of which in 1916 was but little more than half that of 1914.

This reduced production was in part due to weather conditions. We are hoping for ideal conditions for the coming year. In any case it appears that our farmers need to study conditions and prepare for intensive culture. So many of the world's workers are engaged in slaughtering each other that the production of the entire world will of necessity be far below normal.

SOME LEFT OVER

WE are proud of this week's Cultivator, but at the same time we are somewhat broken up over the fact that much valuable material has necessarily been omitted. Mr. Briggs' account of the Poland-China sale at Hanford, columns of news notes from all over the state and the coast, market reports, and much other matter has been "put on the galleys" for next week.

TILL WELL

Never was there a year with more of promise than this? Produce more. Produce better. The work put on the soil and the fertility put into it will determine the profits.

Tree Sprays

Whether or not your crop will pay for the labor, and outlay, largely depends on the care of the trees and the spraying. These depend on the quality of the materials used in compounding the remedies and sprays.

Scientific preparation, backed by the name, insure you the quality of

Orchard Brand

Bordeaux Mixture
Atomic Sulphur
Soluble Oil
Arsenate of Lead
Lime Sulphur Solution
Distillate Oil Emulsion

Besides the certainty of quality, there's the advantage of consulting Mr. S. W. Foster, entomologist in charge of the insecticide department. Write to him for advice on any of your orchard troubles.

Send for the pamphlet you need to help solve your problems:

1. How to control the principal insect enemies and fungous troubles of deciduous fruit trees during the growing period.
2. The dormant spraying of deciduous fruit trees west of the Rocky Mountains.
3. Orchard Brand control of pests and diseases.

Use our service department—write us freely—the more help we can give you, the more success you will have. It's free.

North California Notes

Glenn County has decided on September 19-22 as the dates for its county fair.

The order of the railroad commission reducing freight charges on rice to Sacramento and San Francisco has been annulled.

A big irrigation project is reported to put water on foothill lands near Oroville, taking water from the north fork of the Feather.

The state insectary at Sacramento is getting ready to ship out 100,000,000 lady birds into the melon fields to take care of the aphis.

Horticultural Commissioner Van Dyke of Mendocino County reports that pear scab cost Mendocino pear growers $31,000 last year.

The first asparagus of the season has been shipped to New York. On account of the cold weather the season is eight days later than last year.

Representatives of sugar beet growers have asked an appropriation from the state legislature to conduct the fight against the sugar beet hopper.

Fruit growers of Eldorado County recently held a mass meeting in Placerville and protested the action of the supervisors in doing away with the office of county horticultural commissioner.

Application has been made to the state water commision for appropriation of 300,000 acre feet yearly of the waters of Putah Creek for the purpose of irrigating 55,000 acres in the proposed Dixon Irrigation District.

One hundred and eighty-seven members of the Glenn County farm bureau have agreed to market butcher stock and grain through Ord Leachman of Orland, who has been appointed market man by the farm bureau.

Farm Adviser Williams of Sacramento County announces the following farm bureau meetings through March: March 17; Franklin, March 21. Orangevale and Elverta have not selected their dates, which will be chosen later in the month.

Central California Notes

The Fig Growers' Association of Stanislaus County held a meeting on March 2nd at Ceres.

Prune and apricot growers are actively campaigning for the success of their organization.

Manager Niswander of the California Peach Growers' has announced a quarter of a cent increase in price on peaches of the holdover 1915 crop.

The rains of the past two weeks have brought happiness to grain growers and cattlemen. Grass and grain have already made heavy growth.

The Cattlemen's Protective Association, at a recent meeting in San Francisco, endorsed the Rigdon hide and brand bill to curb the activities of cattle rustlers.

Directors of the California Peach Growers' have decided to start an advertising campaign in the East. The association has not yet received a name for its peeled peaches.

County Horticultural Commissioner Roullard of Fresno urges all growers who find vines infested with phylloxera to refrain from removing the stumps to other sections, thereby spreading the trouble.

The high record mark for prices of butter fat was established in Stanislaus County last week when the Modesto creamery paid 50 cents a pound to ranchers. A year ago butter fat was purchased at 34 cents a pound.

Cattle thieves in California have stolen more than $200,000 worth of cattle in the past year, according to statement of members of the California Cattlemen's Protective Association recently assembled at San Francisco.

There was a large attendance of table grape growers and packers in Fresno February 17 to discuss growing, shipping and legislative problems affecting their industry. J. W. Jeffrey, in charge of the viticultural station of the state at Dinuba, told the growers of Eastern criticism of the Emperor pack.

The Final Answer

To the Tractor Fuel Question

WE believe that a farmer who buys a kerosene tractor costing hundreds of dollars is entitled to get what he pays for.

We **know** that **Titan** tractors are real kerosene tractors. When you buy a **Titan** tractor you are safe. You have the **written guarantee of a responsible Company** that your tractor will do good serviceable work, **using common coal oil as fuel** at all loads. That is the final answer to the tractor fuel question.

Titan tractors are now built in three sizes, 10-20-H. P., the 3-plow outfit; 15-30-H. P., for 4 and 5 plows; and 30-60-H. P. for the heaviest work of the largest farms. All operate on kerosene.

The 10-20-H. P. size is a two-speed tractor, 1.85 and 2.50 miles per hour, with a smooth running twin-cylinder engine, slow speed, mechanically oiled, starting and running on magneto. It can be used for any field work you would expect nine or ten horses to do, and it will run any machine that takes up to 20-H. P. at the belt.

If you place your order soon you can have a **guaranteed Titan tractor** for the heavy spring work. Drop us a line so we can send you full information at once. Don't wait. Write now.

How Old was The Old Oaken Bucket?

THE "iron-bound" bucket that hung in the well was covered with moss but the hoops were always tight and the bale was always secure. Time left its impress on the wood and on the metal but *rust* did not eat through the iron although the bucket was subjected to the severest of exposures. The iron was *pure* iron and pure iron resists rust.

"ARMCO" IRON CORRUGATED CULVERTS

By chemical analysis these are purer iron than were the hoops of the old oaken bucket. Under similar conditions "Armco" Iron should outlast even the old-fashioned ron. Under highways and railroads all over the country, "Armco" Iron Culverts give service like that of the old oaken bucket. They are the only metal culverts that can be counted on to outlast the generation that installs them.

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing, and Formed Products, write the manufacturer in your vicinity, or

In our every issue there are new advertisers. Are you keeping in touch with them?

See the Difference

BETWEEN THE

NEW DE LAVAL

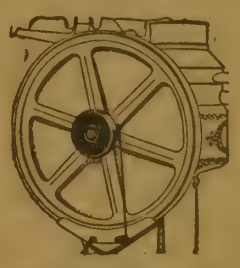
AND OTHER

CREAM SEPARATORS

YOU can *see the difference* between a NEW DE LAVAL and any other cream separator right away.

And five minutes spent in comparing the bowl construction, the size, material and finish of all the working parts, the manner of oiling, the tinware and the frames, will surely convince you of the superiority of De Laval construction and workmanship.

Then if you go a step farther and turn the cranks of the two machines side by side for fifteen minutes, running milk or water through the bowl, you will see still more difference.



Every New De Laval is now equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed and uniform cream.

Speed Indicators can be furnished for use on old style De Laval machines at a cost of $3.00 each.

And if you will run the two machines side by side in practical use, as any De Laval agent will be glad to have you do—the De Laval one day and the other machine the next—for a couple of weeks, you will see still greater difference in the work of the two machines.

There is a De Laval agent near you who will be glad to explain all the improvements and advantages of the NEW De Laval, and who will set and start a machine for you on your farm and let you *prove the difference* for yourself.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

Wanted---Cattle Loans in California

CATTLE loans comprise a new element of business in California banking circles. There are very few banks in this state which are cultivating this desirable investment. Their failure to appreciate the value of cattle paper is because they are not fully conversant with the cattle industry.

California feedlots and pastures absorb several hundred thousand head of beef cattle annually. This number of cattle represents a valuation of approximately $35,000,000. The majority of the cattlemen who have ample supplies of feedstuffs and wish to buy grass steers from the Arizona and California rangemen are handicapped in securing loans to carry them along until the animals are fattened and shipped to the killer. Within four to six weeks the movement of grass cattle from the winter ranges to California feed lots will be in full swing.

At market centers like Portland, cattle paper has long ago proven its worth to the banks. In the February issue of Rand McNallys Bankers Monthly F. N. Shepherd, cashier of the Empire National Bank, Lewiston, Idaho, covers the subject of cattle loans in a very able manner. After briefly sketching the cattle industry by showing how our open ranges were rapidly passing, how this affects the supply of beef cattle, etc., Mr. Shepherd goes into detail and tells the story of cattle loans from the bankers standpoint.

Animals which formerly ranged freely over the public domain are now kept under fence and are no longer subject to the vicissitudes of the seasons for water, shelter and food. This change has had the effect of putting the industry on a more scientific basis and making more desirable paper based upon cattle as security, in that the business is more stable and less liable to wide fluctuations. for while cattle values may vary widely over extended periods, these fluctuations are very slight over short periods, and the cattle feeding business is of comparatively short duration.

Ten years ago we were exporting $150,000,000 worth of beef annually. Today we are importing beef. Within six years our beef cattle have decreased from 50,000,000 head to 30,000,000, while our population has increased 20 per cent. The average price of beef cattle during the period from 1905 to 1915 increased from $15.15 per head to $33.39, and this year they are much higher.

Cattle paper is classed under three heads: Live beef loans, stocker loans, dairy loans. Live beef loans, or as they are often called, feeder loans. are usually made for the purchase of steers to be put on feed for fattenting. Where the borrower is a man of known integrity, has an ample supply of feed and the proper facilities for housing, watering, and caring for the animals, the entire purchase price is usually loaned, and as security a chattel mortgage is taken covering both the cattle and the feed.

Section 13 of the federal reserve act permits rediscounting of this paper. To bankers who know and understand them these loans compare most favorably with prime commercial paper and are highly regarded as secondary reserve, and in the territory where cattle loans are frequent the supply is seldom equal to the demand.

Stocker loans run for a longer period and are not considered quite as good, but still high class. Stock cattle consist of cows, young heifers and steers, which are kept on farms or ranches for growth and breeding purposes. Through the natural increase in calves and the growth of the young animals the security behind stocker cattle increases in value during the life of the loan.

Dairy loans are considered better business for the local banker than for the bankers at the money centers. Where the borrower knows his business, has heavy producing cows, and knows how to dispose of his product these loans are very desirable for the local banker.

Since the federal reserve act admits rediscounting of cattle paper with maturities up to six months, and the number of loan companies has increased at the livestock centers, the security has been standardized, because it is desirable, widely known and salable.

While many of the applications for large loans come direct to the livestock banks or cattle loan companies, cattle loans are, for the most part, made in the ordinary course of business by the country banker acting individually for his bank.

The cattle loan company acts as a broker and through its various connections or sales organizations places the paper with city banks or the investing public, using much the same methods as the mortgage loan companies or commercial paper houses.

Behind paper so acquired the ultimate purchaser has as security the live stock—a life necessity for which there is at all times a cash market—the financial and moral responsibility of the stockman, the guarantee of the local banker and the endorsement of the cattle loan company.

Livestock puts fertility in the soil as well as money in the bank, and those communities which rest upon livestock are on a sound foundation and for the most part prosperous. The livestock grower is not a mere soil tiller bartering a raw material, but a manufacturer selling a finished product. In liquidity, rate of interest earned and amount of risk involved the banker will find cattle loans, carefully taken, to compare favorably with prime commercial paper. In purchasing them he not only acquires a good security but encourages an industry meriting support.

and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves. It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 8 Waukegan, Ill.

When writing advertisers, mention the Cultivator.

marked her last year's performance. In the seven days just passed, beginning 93 days after calving, she has yielded 24.40 pounds butterfat, or 30.50 pounds butter (80 per cent). She continues to surpass all previous marks set by a California cow, having just increased the 90 day record to 320.77 pounds fat (400.96 pounds butter) out of 7931.3 pounds milk. Her other records, as previously reported, are, seven days butter 35.38, thirty days 142.34, sixty days 275.02.

"It is interesting to note the market value of her product, in view of the fact that butterfat has been at the highest during the period that she has been in test, the average being a fraction above 40 cents. Her 90 days yield of butterfat figures $128.30, and with an additional credit for 7000 pounds of skim milk at 20 cents per hundred, totals $142.30, an average of $47.30 for each 30 days.

"According to government statistics the 90 days production of this cow exceeds the yearly yield of the average cow in the United States by more than 100 pounds butterfat. Her product exceeds that of five of the average cows of this country, and the reader may make his own deductions as to the comparative yield of profit.

"A few words with reference to the breeding of Aaggie Acme of Riverside 2d may also be of interest. She may be called a line bred cow, being a double granddaughter of Juliana King of Riverside, son of Juliana De Kol, famous at one time as California's world record two year old. In addition to the dam of this cow whose record is 28.35 pounds butter in seven days and 808.82 pounds in one year, Juliana King of Riverside has a three and a four year old daughter that have made respectively 1021 and 1011 pounds butter in one year, one of which was a world record at the time. Eight of his 15 tested daughters have records over 700 pounds, including three under mature age.

"Aaggie's sire is King Mead of Riverside, son of Juliana King of Riverside and De Kol of Valley Mead, 25 pounds in seven days, a noted show cow, a high producer and the dam of three high record daughters. Five two-year-old daughters of King Mead of Riverside have averaged in yearly test 721 pounds butter and over 14,000 pounds milk, one of these holding the state two year old record of 870.61 pounds butter in one year.

"Miss Valley Mead, De Kol Walker, the two year old heifer that has just broken the world's seven day record eight months after calving and for six months averaged 94 pounds butter per month, has for her dam, De Kol of Valley Mead 2d, a full sister to King Mead of Riverside, and her great capacity is no doubt due in a large measure to these blood lines."

OLEOMARGARINE LEGISLATION

The secretary of the National Dairy Union is mailing "Protest of the Dairy Interests of the United States Against the Underwood Oleomargarine Amendment". This is a 12-page pamphlet, and we doubt not it will be mailed if request is sent to National Dairy Union, 37 Bliss Building, Washington, D. C.

"In behalf of the 4,500,000 dairy farmers of this country, we most emphatically object to any legislation affecting this great billion dollar industry at this time in the manner in which it is being taken up. The farmers of the country had no intimation that legislation so detrimental to the dairy industry would be attempted at this time. We oppose this amendment for the following reasons:

"That the legislation proposed is destructive of the great dairy industry and in favor of the interests seeking to foist on the public oleomargarine colored in imitation of butter.

"That the purpose of the amendment, as expressed in the title, namely, 'To provide increased revenue to defray expenses of the increased appropriations for the army and navy, and the extension of fortifications, and for other purposes' is incorrectly stated. A title fittingly expressing the effect of such a law would be 'To destroy the great dairy industry of this country in favor of the oleomargarine interests, and, incidentally give the federal government $1,000,000 of revenue for every $10,000,000 taken by the oleo—the beef trust—interests above a legitimate profit.'

"That if it is true that oleomargarine is the poor man's substitute for butter,

They are Right!
RIGHT as producers.
RIGHT as breeders.
RIGHT as individuals.

That sums up the facts concerning the herd of registered Holsteins owned and developed by H. E. Cornwell, Modesto, Cal. But to arrive at the sum total we had to add together the splendid blood that Mr. Cornwell selected for foundation; the careful matings he has made of select animals during the years it has taken him to build the herd up to its present size and quality; the creditable official records made in the herd; the good semi-official yearly records, both of milk and butter; the consistent show ring winnings of members of the herd; and the splendid way in which the herd is breeding on in both form and production.

AND NOW—this good herd, consisting of 11 A.R.O. cows with records up to 26.50 pounds butter in 7 days; 6 cows with semi-official yearly records up to 707.31 pounds butter; daughters of A.R.O. and yearly record cows; several well bred young bulls; and the great young herd sire, PRINCE HISKE WALKER, son of Prince Gelsche Walker, will be sold by us at Mr. Cornwell's ranch near

Elliott-Brant Rancho Guernseys Are Persistent Producers

The results of our first two years of official testing show our herd to average 10,172.28 Pounds of Milk and 507.97 Pounds of Fat. One half of these cows were heifers with first calf who averaged 8,670.24 Pounds of Milk and 436.01 Pounds of Fat (only 7 pounds under the average of all A.R. records). Our mature cows averaged 12,710.5 Pounds of Milk and 621.52 Pounds of Fat (120 pounds over the average of the mature cows of the breed).

A bull from these cows will increase the production of almost any herd.

Request your storekeeper to supply the goods advertised in the California Cultivator.

it is a crime in these days of increase in the high cost of living to increase the tax thereon 700 per cent, and the actual price to the consumer a considerable increase above this tax.

"That the evidence is conclusive that the oleomargarine frauds are due entirely to the law permitting it to be colored in imitation of butter, and that the Underwood amendment, if enacted into law would restore the intolerable conditions that prevailed when the two-cent oleomargarine law was in effect.

"That if the real intent of this amendment is to raise revenue regardless of the unjust burden such tax would place on people in proportion to their poverty, then the government could raise as much honest revenue—if increasing the tax on the poor man's substitute for butter 700 per cent can be called honest—by inserting a clause in the amendment absolutely prohibiting the coloring of oleomargarine any shade of yellow whatever."

POLAND-CHINA STATE ASSOCIATION ORGANIZED AT HANFORD

Written for California Cultivator
By C. A. Briggs

ON Tuesday, March 6, at Hanford the Poland-China breeders of the state organized the California Poland-China Breeders' Association. The officers elected were W. F. Bernstein, Hanford, president; O. L. Linn, Modesto, vice president; R. H. Whitten, Los Angeles, secretary-treasurer; C. R. Hanna, Riverside; N. Hauck, Alton; H. I. Marsh, Modesto; Mark Bassett, Hanford, directors. The directors and officers form the governing board. Thirty-two members present signed the roll and paid their membership dollar. The association will hold a

Contagious Abortion

Appears in Highly Bred Herds of Dairy Cattle

The intense breeding and milking strain such cows are under makes them especially susceptible to this infection in its most dangerous form.

Careful breeders take no chances, as they know that in the past when Abortion has become prevalent in any herd it has taken years to stamp it out, Research men of the U. S. Government and other institutions assert that there is no absolute Abortion "cure," but that it can be controlled so that the loss of calves is stopped. No serum or vaccine has been found that gives any protection. These authorities all recommend that a thorough system of sanitation be followed on every farm, including treatment of bulls, cows, calves and buildings. This is the only certain means of controlling and preventing Abortion—Sterility — Premature Birth — Retained Afterbirth in cows and white Scours in calves. These all seem to be symptoms showing the presence of Abortion germs.

In the case of Abortion itself the germs inhabit and develop in the albuminous matter in the vagina and uterus. Used as an injection, the germicide Bacili-Kil (commonly called B-K) dissolves the albumin, cleanses the tissues and destroys the germs, B-K does not irritate, but is soothing and healing to torn membranes, and does not cause straining. Other substances such as carbolic acid, cresol, iodine, etc., are more or less irritating, do not dissolve albumins, but tend to coagulate or thicken them, thereby preventing destruction of the germs and through cleansing of the infected tissues.

B-K is a wonderful germ-killer. Its remarkable germ-killing strength is plainly marked and guaranteed on every package. B-K contains no poison, acid nor oil—it is clear and clean as water and as easy to use. B-K may be used freely in the drinking water, helping to destroy the germs which accumulate in the tanks; also helping to disinfect mouths, throats, and digestive tracts.

B-K is handy. You have in one jug, all ready for use by simply mixing with water, your treatment for calves, cows and bulls; also the best disinfectant you can possibly have for general use—no special mixing of various ingredients—saves trouble and mistakes — insures promptness, accuracy, convenience and successful results.

Contagious abortion is being successfully controlled in many herds by following our simple plan with B-K. One man writes: "I have been using B-K according to directions and the results have been very gratifying. My cows have every one passed the time for aborting and are calving all right in a natural way. I had lost $1,500.00 on my cows and feel that B-K cleaned up the trouble entirely."

B-K is sold by dairy and farm supply houses, druggists, general stores, etc., everywhere. If your dealer does not have it, send us his name.

Send for the "evidence" and these interesting, useful booklets founded on practical farm experiences.

consignment sale at the Sacramento state fair. The organization meeting and banquet was largely attended and great earnestness and enthusiasm prevailed. Addresses were made by W. F. Bernstein, O. L. Linn, R. F. Guerin, R. H. Whitten, D. O. Lively and James McCord.

The Poland-China men have long felt the need of a state wide organization and the move now made will advance the best interests of the breed and the breeders. H. I. Marsh of Modesto during his remarks made a hit when he said "The individual cannot advertise and boost a breed, but an organization can."

FIELD NOTES

S. F. Williams, Orland, reports sale of a registered Jersey bull to M. C. Finch and a Poland-China boar to Arthur Hughston.

John Burrell, Hanford, has sold two fine jacks, one to Peter Miller for $1250. This jack is Grand Duke, that was grand champion at Hanford in 1916. The other sale was to Adolph Camarillo for $3000. Mr. Burrell has a number of fine big boned jacks that are good to look at.

Many High Class Holstein Herds will be represented in the public auction sale of 20 registered Holstein bulls to be held May 24 at Chico, under the management of California Breeders Sales and Pedigree Company. To date the following herds have made consignments to the sale: University Farm, Davis; Fred W. Kiesel, Sacramento; A. W. Morris & Sons Corporation, Woodland; Bridgford Co., Knightsen; Henderson Co., Sacramento; Palo Alto Stock Farm, Palo Alto; Toyon Farm, Los Altos; and The J. S. Gibson Co., Williams. The dairymen of Northern California are thus assured of an exceptionally high class selection of bulls of breeding age in this sale.

Dr. J. W. Henderson, owner of the Bella Vista herd of Guernseys, reports some records of his herd. He writes: "The old dam, Clementine Mabel 19901 who recently gave me her 11th calf and is giving over 50 pounds milk daily in her 13th year. She produced four females, one a twin with male and sterile. Of her other three Golden State Beauty, her first calf, produced a bull calf which was first in his class at the California state fair 1913. Of her four daughters all have qualified for Advanced Registration and as they were from three different sires she can be accused of handing something down. Her last and only other son is a good one and goes into a good herd and will be heard from later. Beauty was never given an annual test on account of one of her teats being snagged with a barbed-wire but officially she produced 71.33 lbs. butter fat in a month.

J. M. Henderson, Jr., president of four banks and many corporations at Sacramento, still finds time to take up the gigantic task of organizing the dairy industry of Northern California. With characteristic thoroughness he has delved deep into the problem of cost of production, and he has already shown a great many dairymen the holes through which their profits are leaking out, and he has produced the figures which have convinced a large number that the dairyman is not receiving an equitable price for his product based upon actual costs of production.

C. B. Cunningham, president of California Swine Breeders Association, and owner of Billiken herd of registered Chester White swine, Mills, is having an exceptionally good demand for breeding stock. It has been interesting to note the progress of this herd over a period of years. To popularize Chester Whites in California in the face of prejudice and opinion as it existed among hog growers even up to three years ago, was a task of no mean proportions. But Mr. Cunningham tackled the job, went about it in the persistent and systematic manner that is characteristic of him, and while his efforts to date may not have established the Chester White as the most popular breed in the state, yet it is remarkable in how many widely separated points in the state one may now find Chesters that "came from Cunningham's herd." The breed has made good in California, and Cunningham has spared no expense in bringing into his herd the very best blood that has been developed in the sections of the country where the Chester White reigns over hogdom.

THE DE LAVAL LINE

Modern, Efficient Farm Equipment of Real Value

Ideal Green Feed Silo and Acme Feed Cutter

Good Ensilage Increases the Milk Flow 25% and Reduces the cost of Butter Fat Production 15% to 20%

Superior in design and quality, the Ideal will return to you as good ensilage every pound of green feed you put into it.

Ten Commandments for Hog Cholera Protection

1. Through the days of thy labors thou shalt remember that swine require special attention in the way of feeding, drinking, housing and general cleanliness.

2. Thou shalt keep daily vigilance over thy flock of wine, lest a portion become subject to cholera.

3. Knowest thou that cholera infection being of easy distribution over the land by rodents of the field, birds of the air and human agencies, it behooves the master of the farm and his attendants and their wives and children to pursue and flay, yea, even destroy pigeons, crows, buzzards, stray dogs and other animals that go from farm to farm; for the same reason, thou should not permit in visitation upon thy swine habitat, strangers, such as peddlers, agents and buyers, nay, not even thy neighbors, lest they introduce cholera and lead to the destruction of thy herd.

4. Watch thy neighbor as thyself, for often it comes to pass that cholera hath stricken his herd and he remaineth silent.

5. Should it come to pass that the scourge hath stricken thy herd, isolate the afflicted ones from the well, using a goodly portion of distance between.

6. Should death overtake one or more of thy porkers, thou shalt observe strictly the Biblical injunction, ashes to ashes.

7. When cholera is rampant over the land, be thou ever watchful of thine animals' habitation. Thou shouldst provide good wire fencing for the protection of thy swine, thou shouldst forever banish from thy doorstep, the filthy, germ laden wallow hole; thou shouldst keep thy hogs in good health, free from lice and worms and thereby resistant to any disease, including cholera.

8. Thou shouldst keep thy swine habitat clean and disinfected at all times, using plenty of slaked lime and crude oil and other recognized disinfectants around the premises.

9. And if these things come to pass and still thy breast be filled with fear lest the danger be imminent, betake thyself to counselors, wise in cholera lore, and take goodly counsel of these. They will instruct thee in the way of having thy swine made immune against cholera through the medium of vaccination.

10. In the time that vaccination hath become necessary and imperative to safeguard thy herd against cholera, thou art admonished to employ a competent person to apply the treatment, and be ye also certain that good potent serum be used. All these things shall be revealed by these counselors, and in the days to come thou shalt profit from the fruit of thy labors and thy nights shall not be spent in grief.

The Dairy Industry in Northern California

Written for the California Cultivator
By Leonard T. Kitts

THE call for dairy products is one of the most insistent, universal, and exacting of all the demands of trade. An infant necessity, a standard food, a common luxury, is the milk of the dairy cow. Dairying is often said to be "the backbone" of agriculture. Agriculture depends on the dairy cow more than on anything else for the best use of its roughage and for soil fertility. Dairying offers one of the greatest money-making opportunities in California for the simple reason that the local consumption is much greater than the production. Butter, cheese, and milk are being brought into the state in large quantities from other states and even from foreign countries.

With these conditions confronting us and the generosity of Mother Nature in bestowing upon us most favorable climatic and soil conditions, the opportunities for profitable dairying are greater in California than in any other part of the United States. For instance, alfalfa grows all the year and can be cut as many as six or seven times, yielding as high as nine or ten tons to the acre. Impoverished lands, a condition brought about in the old wheat farming days, have been re-

Practical Poultry Building

Written for California Cultivator By Frank P. Penn, St. Helena

ON the average farm and with the average busy poultry keeper too little time is given to laying out definite plans for the new poultry house. Most of us get a vague idea of what we want and then start to work. By following such a course we materialize these vague ideas into a vague sort of poultry house and besides we are constantly running against obstacles which could have easily been avoided had we used our heads before we began to use our hands. To the beginner with poultry who contemplates building, he not having had the opportunity to study the needs of the hen, we would advise getting building ideas from some poultry publication, books, or state or national bulletins. Many good building points can be found in these building plans, and by borrowing from each we can build them into a house which will meet with individual requirements, no matter where we are situated or upon what manner of soil. Having just completed some poultry houses this building problem has been one of present thought with me.

Of even greater importance than the building itself is the location. Study your ground as to its natural adaptability for poultry keeping. These essentials are slightly rolling ground, porous, if not gravely soil, southern or eastern exposure with ample shade. Such a location is ideal and not always obtainable in each detail. However most of these can be found upon any fair sized ranch. Better have such a location than a fancy house. Proper location is an absolute necessity to the easiest success obtainable. Sloping ground gives proper drainage; porous soil does away with contamination; proper exposure is an ill preventive, so let Mr. Sun be your germicide.

For each 36 hens we have built a house of two pens of 18 birds each, intended for breeding yards and raising young stock after leaving the brooder. This house is 12 feet long, 7 feet deep, 7½ feet high in front and 4½ at the back. This gives you a scratching floor space of 21-3 square feet for each hen, which we deem ample for all practical need. This house being high roofed, as shed roofs go, at the back, enables one to put the perches at the back with nest boxes underneath, still leaving the floor free for scratching material.

The dropping board is made permanent like a table. The roosts are made of two inch boards nailed to two heavier pieces hinged at the back to the wall of the house, allowing the ends of the roost supports to rest on the dropping board some nine inches back from the front. In cleaning the dropping boards one has to merely raise the roost frames up and fasten them to the roof and he has everything clear before him. The droppings are raked into a box and carried to a place fixed for them outside the yards. This should be done, at least twice per week. The entire front excepting two feet down from the roof of this building is open, being covered with tightly stretched poultry netting. A drop curtain is conveniently rolled up in its place to be used during exceptional storms. Such a house having a roof projecting some two feet in front will remain dry under ordinary weather conditions without the use of the curtain and is very accessible to the sun's rays. Being on a slight elevation sloping to the southeast and facing the same direction it receives the morning sun entirely over its floor space and is protected from south and west winds and rains.

We would have no other than dirt floors. Here the hens can bathe in the soil after digging the grain out of the litter. What chance has the hen with vermin on our perfectly nice looking cement floors? No matter if some dust does fly as the hens take the much needed baths and in scratching. Dust is not at all healthy for vermin. We have tried earth, wood and cement, and of the three cement has the least to recommend it. And while on this line of thought let us guard against nice looking and personally convenient points of poultry house construction when these points are actually detrimental to the fowl's welfare and therefore our poultry profit.

Each of these pens has a large yard running back among the oaks. Do not stint your fowls for yard room.

Such a house as above described will cost much below $1.00 per fowl, which among poultrymen is a low estimate. It is practical, sanitary, sightly and easy of construction.

Is it not better to use an hour planning definitely what we desire our finished house to be than to grab hammer and saw and create an unsightly something which is not convenient for fowl or attendant. A commonsense poultry house will save us months of labor during its life.

STORRS EGG LAYING CONTEST

Storrs, Connecticut.—Report for week ending February 27, 1917.

In the seventeenth week of the laying contest at Storrs the hens made the biggest gain in any one week during the past two years. They laid a total of 3680 eggs, a gain of 617 over the previous week's yield and 659 eggs better than for the corresponding week last year. They are now farther ahead of last year's record than at any time during the contest.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Fairfields Poultry Farms, 522; Jules F. Francais, 468; Rodman Schaff, 381.

White Wyandottes

Merrythought Farm, 577; A. L. Mully, 488; Brayman Farm, 465.

Rhode Island Reds

Jacob E. Jansen, 55; Geo. W. Harris, 513; Hillview Poultry Farm, 496.

White Leghorns

A. P. Robinson, 677; Hilltop Poultry Yards, 562; J. O. LeFevre, 552.

Miscellaneous

Koshaw Farms (Buff Rocks), 455; Obed G. Knight (White Orpingtons), 471; Cloyes & Sullivan (Buff Wyandottes), 450.

THE FREE POULTRY SHOW

One of the features which made the Missouri state poultry show so popular with the exhibitors and the general public last year was the free admission to the show room, and the officers have decided to again throw the doors open to the public, at this year's show which will be held in St. Joseph, December 5-9. This plan has been tried in a few eastern shows and received very favorable comment. Poultry shows are held for the purpose of competition to learn who owns the best birds in each variety, for the advertising value, which is very important.

The other purpose of a large poultry show is to develop trade for pure bred poultry, and a great many sales are made each year, to beginners who get the "poultry fever" when they see so many fine specimens on exhibition. The poultry breeder who has a lot of fine birds, but never exhibits them at the big shows, has to sell his surplus at market prices for lack of a buying public who would be glad to get some of his stock at remunerative prices if they knew what he had to sell.

In this department next week Prof. Dougherty of the university farm will report of results from electrically lighted hens.

Your Eggs
Do They Pay Dividends?
They would if you hatched them in a MODEL INCUBATOR and raised the chicks under a Model Hover. These machines are guaranteed result-getters.

TURKEYS

GIANT BRONZE TURKEYS

Let me tell you how to make more money on turkeys. Large turkeys can be raised at practically the same cost as small ones. It is in the strain. By scientific cross-breeding I have developed a strain of turkeys which mature rapidly, and attain unusually large size by holiday time. You can introduce some of this blood into your flock and make money by it the very first year. Gold Nugget strain wins again. At Pacific Coast largest shows, 1916, the California and Arizona State Fairs and San Diego, also the great Los Angeles Show 1917, eleven prizes eleven entries. Stock and eggs from my flock should put you in the Giant Bronze Turkey lead in your locality. Toms for sale, also eggs. Write for circular. Raised on 320-acre farm. Address J. Will Blackman, 607 East Third St., Los Angeles, Cal.

Bourbon Red Turkeys—Blue ribbons at Panama-Pacific, California and Arizona State Fairs, Los Angeles, since 1914. Eggs for April delivery, $5.00 per 12. Mating list. The Ferris Ranch, S. Reservoir, Pomona, Cal.

ST. PATRICK'S DAY

'Tis springtime in old Ireland,
My homeland far away,
Where all the flowers are waking,
And all the fields are gay.
But, oh, this lonely heart of me,
The ever faithful part of me,
Is throbbin' with its sobbin'
This lone St. Patrick's day.

'Tis springtime in old Ireland.
Though far from there I stray,
I hear the lark's song ringing,
Its sweet notes with me stay.
But, oh, this weary soud of me,
Beyond all control of me,
Is burnin' with its yearnin'
This lone St. Patrick's day.

'Tis springtime in old Ireland.
But here the skies are gray,
And memory wakes a sadness
That time cannot allay.
The heart, and soul, and mind of me—
Acushla; 'tis the kind of me—
Are throngin' with their longin'
This lone St. Patrick's day.
—Youth's Companion.

A beautiful home means a simple one. Too often we get the idea that a lavish outlay of money is indispensable when really it is not at all necessary or even desirable.

THE STORY OF ST. PATRICK

THIS is one of the many stories told of the life of the good St. Patrick whose birthday is coming to be more and more generally celebrated on the 17th of March—the 17th of Ireland as some good Irishmen call it.

"To begin with, he was born about the year 387 A. D. at Boulogne-Sur-Mer and was named Succat by his father, who was a deacon, and was a nephew of our beloved St. Valentine, whose birthday we celebrate on the fourteenth of February. He led the usual life of little French boys, playing games, sailing kites and indulging in the pastimes of that day, until he reached the age of seventeen years, when a band of pirates captured him and sold him to the great Irish king, Neall Mor, or "Niall of the Nine Hostages." The king, after his conquests in Britain and France, returned to Ireland, taking his captive with him, and hereafter the boy became known by the Roman name of Patricius.

"For six years he attended the sheep on the hillsides, but history does not tell us whether, like Little Bo Peep, he lost any of his flock or whether he was a good shepherd; but once while minding his flock a strange hermit appeared before him and presented him with a staff. Resting on it he went to sleep and dreamed that he saw a ship approach the shore and heard a voice tell him it had been sent to take him home. Shortly after this dream such a ship arrived and he boarded it and sailed for France, where he became a priest or monk, and when the Pope heard of him he sent him back to Ireland to become a missionary to the people with whom he was familiar.

"Taking his magic staff with him, he reached Croagh Patrick, where he was immediately assailed by demons, so he gathered all the serpents, toads, and all manner of venomous creatures together and with his magic staff drove them into the sea, where they were destroyed. From that day Ireland has been fre from any venomous serpents.

"St. Patrick next began his work amongst the inhabitants of the country. He found them worshiping snakes, the sun, the moon and fire, and their priests offered up human sacrifices—usually a girl or boy—when they wanted a special gift from their god. These priests were called Druids—from deru, an oak—as the oak was reverenced by them and their services were held beneath its spreading boughs. Their altars were decorated with mistletoe and were always in the deepest, wildest part of the forest. St. Patrick began to teach them to give up their idols and spectres, and to turn to the only true God. In order to do this he used his magic staff to work miracles. First, he caused their fertile lands to become bogs—like our swamps. Then he destroyed all the fish in the rivers; next he charmed the fires so that while they made a bright blaze, they would not boil their kettles, and as they did their cooking in these kettles in the open air they had no cooked food to eat. Finally he cursed the earth and it opened up and swallowed all the Druids. No longer troubled with them or the demons, he preached to the people and converted them, laboring as a missionary for thirty years. He lived to be one hundred and twenty-five years old.

"In one of his sermons he used the little shamrock leaves, growing at his feet, as an illustration. From that time it became Ireland's emblem, and though he has now been dead a thousand years, every child of Erin wears it in his honor on the seventeenth day of March."

ST. PATRICK

"Along about the time when Ireland annexed America—whenever that was—St. Patrick became the patron saint of America, and the patronage still continues," writes Chester Rowell in the Fresno Republican. He continues: "So let us acknowledge the annexation, and be proud of it. Sure it was no dour fairy that annexed us to Ireland, but a blithe and kindly one, that knew our needs. Many things we had, but of laughter and tears and quick wit and quick temper, and the fire

Heap big mileage!

In every layer of fabric, in every bit of rubber—permeating the entire casing! No wonder Savage Tires average so much greater mileage.

Savage Tires are built to give mileage first, then road comfort and complete satisfaction—they are *not* made to sell at a price. And yet Savages cost no more than ordinary casings.

Sold through our own distributors. We put the middleman's profit into extra quality—"Heap big mileage!" Watch for the red Savage sign.

IRON AGE
GARDEN TOOLS
Answer the farmer's big questions: How can I have a good garden with least expense? How can the wife have plenty of fresh vegetables for the home table with least labor?
IRON AGE Combined Hill and Drill Seeder
solves the garden labor problem. Takes the place of many tools—stored in small space. Sows, covers, cultivates, weeds, ridges, etc., better than old-time tools. A woman, boy or girl can push it and do a day's hand-work in 60 minutes. 33 combinations, $8.25 to $15.00. Write for booklet.

and light and brightness of life our Puritan ancestors had bequeathed us less than enough. Ireland—blessed be St. Patrick—supplied the deficiency. So we will all wear shamrocks today, and it will not be unpatriotic or unneutral if some of us also whistle 'The wearin' of the green.'"

SALADS AND DRESSINGS

With the coming of the first warm days there is an especial appeal to the palate in a salad that is a little different. Here are some suggestions:

Lemon Jelly Fruit Salad

Soak half a package of gelatine in one cup of cold water for an hour, then add half cup lemon juice and two cups boiling water. Turn into bowl, and when jelly is set, with a warm spoon scoop out the jelly, leaving a shell an inch thick. Fill this with a mixture of oranges, tart apples and celery which have stood in a French dressing for a few moments. Cover with liquid jelly and when stiffened and ready to serve, turn out on leaves of lettuce in a shallow salad bowl. Serve and garnish with mayonnaise dressing.

Savory Salad Dressings

The usual salad with French dressing is too seldom varied. With a little pains the dressing may be changed. The gist of the whole matter lies in the vinegar. The experienced salad maker experiments with many different flavorings, keeping several cruets ready all the time. Tarragon vinegar, vinegar which has stood on crushed celery seeds and a bay leaf, or which has had dropped in it two or three cloves of garlic, all give a different flavor. A tablespoonful of chopped mint or a dash of Worcestershire gives what is known as English dressing. Italian calls for much onion, and Japanese for soy. Lemon juice gives a delicate flavor, and even a sprinkling of some spice like mace makes an entirely new and delicious flavor.

Fruit Salad Dressing

Two eggs, one-quarter cup each of lemon juice and sugar. Beat the eggs, add the other ingredients and cook in a double boiler, stirring constantly until the dressing commences to thicken. Cool and pour over sliced fruit any combination desired.

Without Oil

A yolk of egg beaten thoroughly with a saltspoon of salt, a teaspoon of mustard, one half of saltspoon of pepper and a whole teaspoon of white sugar. Mix in gradually thick cream to make dressing of desired flavor, and lastly work in a tablespoon of vinegar drop by drop.

OUR HOME GARDEN

Written for California Cultivator
By Clara I. Remington, Los Angeles

TWO years ago my husband and I purchased our present home, a "half acre" lot, 150x120, sandy soil with six full bearing walnut trees, which yield us an income of $20 a year. We set out a number of two year old fruit trees, which will bear this year for the first time. My husband does the heavy work, such as plowing, etc., while I do most of the planting, irrigating and cultivating. It has been my first experience in gardening, being city born and bred and an ex-business woman. Of course, my first desire was to plant a little of everything, but experience has demonstrated that while some things do exceptionally well in our soil and locality, others are almost a complete failure.

Of those crops which are permanent, and need little care, outside of pruning, thinning out and fertilizing, we have blackberries, blackcap raspberries, strawberries, rhubarb, asparagus, parsley and chayote. Carrots are in the ground the year round and cabbages are always growing from occasional plantings. Lettuce we enjoy from early spring to late fall, as well as White Icicle radishes. Have a thrifty patch of onions this winter as a result of sets planted in October.

Last year we dug three sacks of Irish potatoes and one of sweet potatoes. Our fall crop of Irish potatoes was killed by the early frost, which also destroyed our late corn crop and our bell peppers, which were carried over from the previous year. Will try pimientos this year. This frost also finished our chayote vine for the season. I planted corn, beginning with Adams Early in February, following

Sudan Grass

Califlora Brand

This is one of the best known forage crops used in the Southern and Middle Western states. It grows from 5 to 10 feet high and will produce four crops of hay under irrigation and usually two crops without irrigation. It thrives in the valley and foothill sections of California. It yields more to the acre than any forage crop we know of, and the quality of the hay is excellent. The stock of this seed is short and we anticipate higher prices in the near future.

BUY NOW—Lb 50c; 10 lbs. $4.00; 100 lbs. $35.00

ALFALFA SEED---Califlora Brand

This is our best grade of common Chilian Alfalfa seed. On every test this brand of Alfalfa seed has surpassed all others. We do not believe its equal can be had elsewhere. When buying this grade you are not paying for any weeds or chaff. It is the cheapest to plant because it is the best. Send for price and sample. We also offer superior stocks of GRIMM, HAIRY and SMOOTH PERUVIAN and TURKESTAN Alfalfa Seed.

SEED POTATOES

Splendid stock of OREGON GROWN American Wonder, Early Rose and Garnet Chili Seed Potatoes. These are all good early varieties. Write for prices and quantities desired.

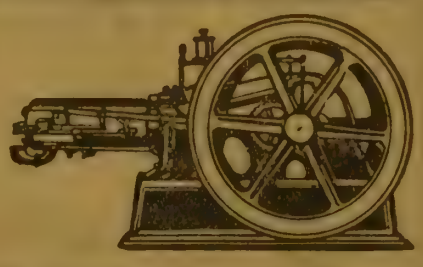
Save Expense and Trouble



It means a lot more than the purchase price to the man who buys an unreliable pumping engine. The time, worry and expense involved trying to get the engine to run right must be added to the first cost. And finally, more time and expense with your pumping plant out of commission while the engine is being changed for another.

Get the Right Engine First

Install a Commercial Engine and you will have no trouble or needless expense ahead of you. Write today for our handsome new catalog and post yourself on all the superior features of Commercial Engine Construction. Remember, an ironclad written guarantee protects the purchaser of every Commercial Engine.

with Country Gentleman and Oregon Evergreen, every two weeks until August, and had it in abundance for the table and canned six quarts. Kentucky Wonder beans was another splendid crop, of which I canned 20 quarts out of the surplus. Lima beans and wax beans did fairly well.

Will plant many beans of different varieties this year with a view to drying most of them. This is a most economical and satisfactory way of carrying things over when possible. I dried celery leaves with great success. Intend to raise herbs, such as sage, mint, thyme, etc., to dry.

Tomatoes are my faithful friend. We have been enjoying them all winter as the result of my 70 quarts put up, not to mention what we ate fresh and cooked in every variety of dish, and eight pints of picalilli made from the green ones. I raised some peas but expect more this year from what I planted last fall and winter. Last year I raised ten pounds of peanuts, while I raised enough popcorn the year before to last both winters.

I made a very successful attempt at raising celery, but much of my crop was stunted by beet nematodes whose identity I just learned through the columns of the Cultivator and which evidently have possession of my place, for I find them on carrots. They ruined my beets last summer when I didn't know what ailed them. It's rather a blow to be up against something I cannot trap, spray or otherwise poison.

My fall planting of spinach, though small, yielded well, and I will double my crop of this wonderfully healthful vegetable this year. A few small heads of cauliflower and two good sized pumpkins but fired my ambition to bigger efforts next season. Cucumbers, summer squash, casabas and watermelons, while they can be grown nicely here, were not a success, due to black aphis, but the first two are neither one a favorite dish with us, and melons, too, take up so much room and come at a season when fruit is so plentiful that we scarcely miss them. Kale, Swiss chard and alfalfa we raise for the chickens and rabbits.

Handicaps are everywhere on our little place. With the spring comes a voracious army to contest our rights to everything grown; ground squirrels, gophers, moles, cut worms and other chewing bugs, worms for cabbage, lettuce and tomatoes, red spider, nematodes, aphis of all sorts and kind and ants of every variety—and a soil which needs vigilant irrigation and cultivation. I am ready for the enemy this year with a good supply of ammunition and an effective spray pump.

Outside of my flower garden, cooking, bread-making, sewing and other household duties, my kitchen garden will ever be my most absorbing and fascinating interest. What it has meant to us as a source of food supply and what it has accomplished for me in the way of restored health cannot all be told here.

In spite of the fact that 100,000 names have been submitted for the new Peeled Peach, which the California Peach Growers (Inc.) is putting on the market, no name thus far received has been exactly what was desired. Much originality and many splendid ideas have been submitted. Many of the words were at first sight "just the thing," but when analyzed from every angle as to their appropriateness and suitability from an advertising standpoint, they have one by one been eliminated and the directors have decided to retain the name "Blue Ribbon Peaches" exclusively for the peeled article. The fact that the peaches are peeled will be brought out in the advertising.

Pardon us, but we believe "Prepared" beats "Practically Peeled".

The General Chemical Company is a corporation with $40,000,000 capital. They are the largest manufacturers of chemicals in the United States.

One of its departments is the furnishing of remedies for the diseases that affect fruit trees and for the killing of insects that injure the crops. These remedies, which they supply, are the result of laboratory experiments by chemists of international fame. As their brands are national they must be protected.

To that end they maintain a service bureau in San Francisco in charge of S. W. Foster, an entomologist for many years in the service of the government stations in California, investigating and solving orchard problems under Western conditions. He is, therefore, thoroughly familiar with orchard conditions of the West, and in position to furnish reliable information and directions for the most efficient control of insect enemies and fungous diseases.

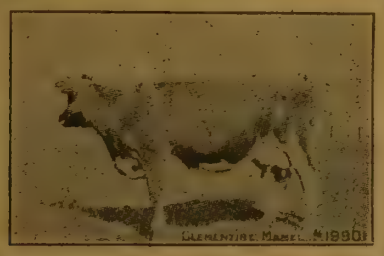
You want Dairy Stock or Hogs?

Any old cow or hog is not now good enough for the up-to-date rancher of California.

He wants Superior Stock, he needs Producing Stock and he must have Economical Stock to make the success his efforts warrant. If he cannot get all pure bred animals of his choice, then a pure bred sire is his aim.

Guernsey cattle and Hampshire hogs have demonstrated conclusively the above characteristics. The next thing to consider is where to get the animals that give promise of the best for the investment, and here is where you will become interested in the BELLA VISTA HERDS. You may always expect to get Herd Headers here.



IN GUERNSEYS—every female in the herd is either in the A. R. or is qualifying for the same. In Males Imp. Lord Kitchener, many times Grand Champion of California, sired a four-year-old which produced over 550 b. f., and a two-year-old in the herd under test has produced over 1230 pounds for the second month and 1168 milk and 47 lbs. b. f. for third month. Dam of Glenburnie Boy, the Jr. herd bull, produced as a three-year-old 13,559 M. and 684 b. f., while her dam produced 12,634 M. and 654 b. f. Bulls ready for service.

IN HAMPSHIRE HOGS—the Jr. and Grand Champion sows of the State are here:

Berkeley King—Grand Champion boar from Gen. Allen, undefeated boar.

KENWOOD 2nd, a model in form, from prize winning ancestors on both sides, is the Jr. herd header.

State Fair Record: 23 prizes in 22 entries. One Grand Champion, 2 Jr. Champions and the Silver Trophy from the American Hampshire Association for best herd bred by Exhibitor.

You want just such stock and I will be glad to furnish it as long as it lasts and at a reasonable cost.

Write me just what you want and I will be glad to furnish you. Address me at my office in Berkeley.

Olive Trees

There is a wonderful future for the Olive industry in California.

The demand for California Ripe Olives and California Olive Oil is growing steadily, and a much larger acreage can be profitably devoted to this great industry than is at present employed.

Grow Olives For Profit

Today there is not a fruit grown in the great Mediterranean section of Europe which is not being successfully produced and marketed in California. The success of the Olive is a notable example.

Manzanillo

The Manzanillo Olive is a regular and prolific bearer—fruit ripens earlier than other varieties. The Manzanillo is a standard for green and ripe pickles; also produces oil of a very high grade. When planting an Olive orchard, it is well to remember that the Manzanillo Olives are picked and in the vats before even commencing to pick the Mission.

Mission

The Mission has always been a popular variety. The tree is a handsome, upright grower—very fine for avenues. Fruit medium to large — makes excellent pickles and a superior quality of oil.

Sevillano

The Sevillano, or Queen Olive of commerce, is the largest of them all. This Olive attains a much larger size in California than it does in Spain, often weighing one ounce a piece. The tree is very ornamental.

For twenty-five years our nurseries have been closely associated with growing Olives. Of late years we have devoted our attention to growing the best types of recognized standards.

Continued from Page 330

habilitated, increasing in value tenfold and will continue to increase in value through the agency of our dairy industry.

Dairying is highly profitable when well conducted because it markets the crops of the farm in the most valuable form and because it is a business of almost indefinite development. The dairy cow may be likened to a factory. She is the medium by which the raw materials are transformed into the finished product ready for market. But no amount of feed or skill in handling will make a profitable cow out of one that does not inherit a strong tendency to give milk. This is why success with dairy cows depends so largely upon the selection of the individual animal by keeping records of milk and fat production. On the other hand no matter how good a producer a dairy cow may be by inheritance she cannot give results without proper feed and management.

Good cows can be made to produce their own value in butter fat every year and yield a calf besides. But every cow is a good eater and many a bossy is petted and tolerated who eats her head off every year without saying a word about it. Dairying is not a matter of sentiment but of business. The values involved are large; the consumption is heavy; the public is exacting, intelligent and critical, and only the best of modern business methods and dairy equipment will insure a continuance of patronage or a balance on the right side of the ledger.

Dairying is made more profitable through the use of better dairy equipment, proved by increased production of clean, wholesome milk and less danger from communicable diseases among the cattle. Barns with the best types of sanitary barn equipment are fast becoming the rule.

The silo is taking a prominent place in the industry in California by providing for periods of short pasture. During our dry season, covering a period of many weeks, the pastures become short and insufficient to maintain a full flow of milk. Probably as much loss occurs during the summer season by lack of feed as occurs from improper feeding during the winter. The silo provides the equivalent of rich, succulent pasture during those periods of the year when green feed is unobtainable.

Economy in feeding alfalfa may be accomplished through the use of a feed cutter. The coarse hay which is generally nosed out and discarded by the dairy cow amounts to approximately 25 per cent of the whole. By running the alfalfa through a feed cutter and then feeding, this coarse hay will be entirely consumed, thereby actually increasing the value of the alfalfa 25 per cent, a saving of from $3.00 to $4.00 per ton.

The dairy industry has made great strides during the past ten years. The dairyman has realized that the production of milk can be made most profitable by applying the same principles that have made other business a success. An analysis of the following tables give some idea of the development of the dairy industry in California during the past ten years:

Butter Production

	Pounds
1907	44,699,211
1908	48,469,585
1909	43,899,018
1910	45,989,140
1911	50,380,738
1912	54,940,886
1913	56,542,709
1914	59,286,460
1915	67,522,402
1916	70,030,174

Cheese Production

	Pounds.
1907	5,928,946
1908	6,262,194
1909	4,431,194
1910	4,648,348
1911	4,640,491
1912	4,785,617
1913	5,600,972
1914	6,016,815
1915	6,249,775
1916	7,745,124

Condensed Milk Production

	Cases.
1907	134,907
1908	100,069
1909	83,476
1910	172,916
1911	116,384
1912	172,309
1913	172,900
1914	274,096
1915	345,402
1916	370,212

Te total value of dairy products in California during the year 1916 was $40,310,105.

The consumption of dairy products has always been greater than the production, not only in California but throughout the Union.

The public is just beginning to realize the value of clean, wholesome milk and milk products as a food. Milk, the best and finest food of mankind, is consumed at the rate of but one glass per day when the average should be at least two glasses per day—double what it is. There is plenty of room for increased production. People are beginning to drink more milk and use more butter and cheese. We need more cows and better cows. It means increased soil fertility and prosperity for the farmers.

All in all the dairy business is one that commends itself to the best of thinking men as an important means of service worthy the exercise of the highest faculties and certain to give prompt and full returns on the capital energy and thought put into the industry.

American Berkshire Congress

The eleventh annual meeting of the American Berkshire Congress, held at Purdue University, Lafayette, Indiana, February 20-22, 1917, was the most successful meeting yet held by this unique organization of Berkshire breeders. Nineteen states were represented. It was a real congress, and the number present brought out in discussion about all the knowledge possessed by the speakers on the topics assigned them.

On Wednesday evening occurred the annual congress banquet. C. C. Pierce of Boston proved himself a toastmaster supreme. Addresses were made by President Stone of Purdue University; H. W. Gossard, Dean C. F. Curtiss and Zed L. Williams. Dean Curtiss spoke on the topic, "Size in Berkshires", and demonstrated that while there may be Berkshires that are comparatively small, the breed ranks as one of sufficient size, that it is an easy feeder and that Berkshires weigh more than they look.

Officers were elected as follows: President, Harry W. Knights, Littleton, Massachusetts; vice president, J. T. Hogsett, New London, Ohio. Secretary-treasurer, F. S. Springer, Springfield, Illinois. Executive committee—The president, vice president and secretary, together with C. F. Curtiss, Ames, Iowa; N. H. Gentry, Sedalia, Missouri; J. E. Dodge, Lowell, Massachusetts; J. L. Thatcher, Riverside, California; C. H. Carter, West Chester, Pennsylvania, and W. S. Corsa, Whitehall, Illinois.

NEW IMPROVEMENTS IN THE DE LAVAL SEPARATOR

Since Dr. De Laval perfected the first cream separator in Sweden in 1878 there have been many improvements made in the construction and operation of these wonderful cream saving machines. In such improvements the De Laval Dairy Supply Company, the world-wide organization built upon the foundation so well laid by Dr. De Laval and his associates, has always been the leader. In fact, most of the changes which have been effected in the gradual improvement of the cream separator during the past 40 years originated in some one of the various De Laval shops, either in America or Europe. The De Laval Company is now making announcement of a new machine which embodies many advantages over previous styles, including a self-centering bowl, greater capacity, easier running and simpler bowl construction. All these and other improvements are fully described in the new De Laval catalogue which will be mailed from the De Laval Dairy Supply Company's office in San Francisco, upon request.

Remco Redwood

REDWOOD FOR DURABILITY

REMCO FOR MECHANICAL PERFECTION

Pipe

For
Irrigation
Domestic Supply
Power
Drainage

In all sizes from two inches to fourteen feet. Built for all pressures, with a guarantee of 100 per cent overhead.

Valves, Fittings, Risers and Reducers furnished to fit each size pipe.

Tanks

In all sizes
from 500 gallons
to
500,000 gallons

Equipped with covers and discharge gates if desired.

Towers furnished to hold any size tank.

Silos

Sizes
10 by 20 feet
to
20 by 40 feet

Shipped complete ready to erect. No extra charges.

Blue prints of proper foundations and erection instructions furnished free.

All made from Clear Air Dried Redwood, seasoned in our own plant; designed by our Engineers; manufactured by Skilled Mechanics using latest and finest machinery. Every Pipe, Tank and Silo guaranteed to be our own manufacture. Our big organization of experts and engineers is at your service, free of charge, for advice or plans.

Just Back from Town with his New FISK NON SKIDS

And a wise buyer is he who makes his tire equipment Fisk throughout. Thousands of today's users of complete Fisk equipment began years ago with a purchase of a single tire.

When you pay more than Fisk prices you pay for something that does not exist

THERE is no better tire quality—no greater mileage—and one set of Fisks will prove that you can't make a better dollar-for-dollar tire investment. If you don't know Fisk Tires, buy one—put it to the test and learn the Fisk standard of tire value. It will be more than worth your while. The price of Fisk Non-Skids is actually less than the plain treads of several other standard makes.

A special feature of Fisk Tire Value is the policy of Free Service through Fisk Branches in more than 125 principal cities throughout the country. There are Fisk Branches in your state, where your home dealer buys direct and is always sure of promptest attention to your wants. And when the Branch is convenient you can go there any time, *whether you use Fisk Tires or not,* and make use of the only uniform and complete Free Tire Service in the country. There is no charge at any time except for supplies and actual repairs. Take the first opportunity to get acquainted with *Fisk Service,* Fisk Organization, Fisk Methods and Fisk Products.

Time to Re-tire?
(Buy Fisk)

If you do not find a Fisk Branch in the partial list below that is convenient to where you live, write for complete list—there may be one nearer you.

FOR THE

Universal

Tractor Attachment

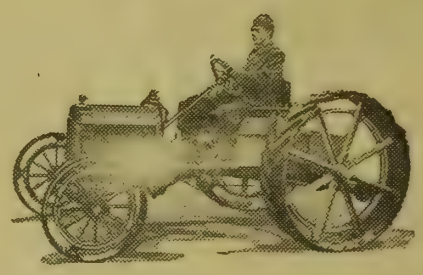
1st The Tractor

In 3 hours your pleasure car is converted into a powerful Tractor.

2nd The Auto

Your powerful Tractor is in 3 hours again converted into a pleasure car.

The Complete Attachment Equipment, 1500 pounds of wrought and cast steel gear and other parts, clamped without mechanical change whatever to your Ford, or other passenger car chassis, gives you the final answer in Farm Tractor Equipment. A Light Tractor of Great Lightness, Great Power, All-Purpose, Handy, Replete with Evidence of Efficiency every way you test it. No complicated parts; easy to drive.



Don't hesitate, get a Tractor—get a Universal —Every farm will have its Tractor.

The Universal is a REAL FARM TRACTOR. No mistake about that. Plows six to eight acres a day. Economical and indestructible. Plowing speed 2½ miles, road 4 to 5 miles. Built on strict Tractor lines. Simplicity. Perfect hitch. Turns in short circles. Simple to attach and detach. No holes to bore. No rubber tires left on. No cumbersome body left on. Works in sand or mud. Power drive. Center flange in front wheels holds tractor to its course. Lots of reserve power for emergency super loads. Nothing new to learn with a Universal. No machinist needed. No six months' experimenting with complicated strange parts. All simple.

The Tractor brought within reach of all---in price and in efficiency, in Mechanical Tractor Perfection, the Universal is the greatest message the Tractor World has known.

"TRACTOR FACTS" and other literature FREE.

"Tractor Facts" tell all about the Universal. It should be read by every man interested in Tractor Equipment. We will send you this folder and other important literature free Write Gerlinger Motor Car Co., Dept. C.C., Tacoma, Wash., or C. H. Mellen, Dept O, Los Angeles.

California Cultivator

Vol. XLVIII No. 12 LOS ANGELES: March 24, 1917 One Dollar Yearly

Plowing Out of Nursery Stock, Kirkman Nurseries

Twenty mules and horses on the great plow lift an entire row of nursery trees in a few minutes. The plow, in the form of a great U-shaped hoop, goes underneath the row, lifting the trees.

Producing Millions of Orchard Trees and Vines

In the San Joaquin Valley Business Methods Combined with Soil and Climatic Conditions Make for a Great Industry. A Successful Year is Just Closing. Illustrations from Cultivator Camera

CALIFORNIA is the first state in the Union in the production of nursery trees. We make this statement on the general principle that if California isn't, it always claims to be. But to stick closer to facts. In 1909 New York produced $2,751,000 in value of nursery trees, while California produced slightly less, $2,213,000. But the spirit of the West and the demands of the West have made necessary immense growth of the nursery industry during the past eight or nine years, and this growth has been so much greater than that of the older states that we are reasonably safe in the statement that California leads the world in the nursery industry.

The greatest nursery center of the state is also its geographical center, or very nearly so. There are large nurseries in other sections, which are noted the world over, e.g., at Pomona, at Hemet and other places are hundreds of acres given to growing rose plants. In San Diego there are other acres given almost exclusively to the growing of poinsettias, or Christmas flowers. Near Sacramento nut trees are given attention and thousands of these are produced. Very near the coast in Humboldt County climatic and soil conditions have induced the planting of broad acres to bulbous plants.

But coming to Fresno, the center of the state and center of the nursery industry, we presume the two greatest features of the business are fig trees and grape vines. However, the nurseries grow literally thousands of varieties of trees and shrubs. Look at the ordinary nursery catalogue and note one section which perhaps contains olives or perhaps roses, and in the latter case, at least, literally hundreds of different varieties, largely Madame This and Madame That; all these made necessary by the demands of the discriminating rose grower. And therein lies one great difficulty with the nursery business, the necessity of keeping thousands of trees and plants which the public may clamor for and, again, may never think to ask for. And the season usually ends with a bonfire, and sometimes with many heartaches on the part of the nurserymen.

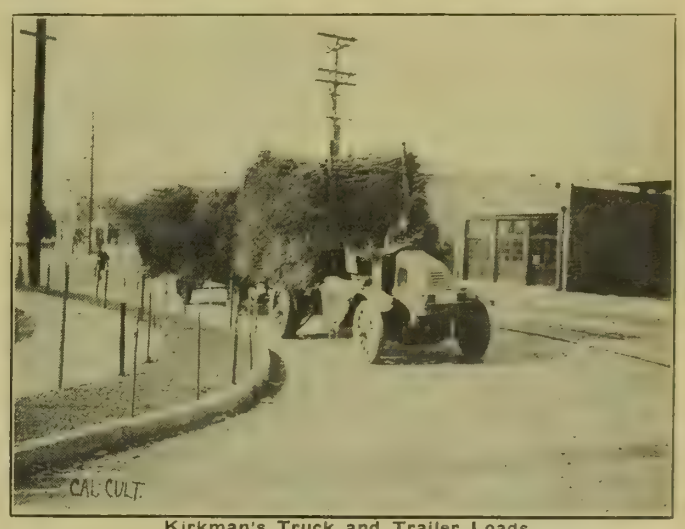
Take staples like the best of canning peaches, even French prunes which this year are in keenest demand, or fig trees of proven worth, and the season may end with thousands, or possibly with hundreds of thousands of trees, whose only avenue of disposal lies through the brush heap. One nurseryman last year reported over a half million trees from his nursery alone sent to the brush pile. We mention this because it is a feature of the business which often is not considered by the layman. The nurseryman has troubles enough that are real.

One of these troubles comes from legislation, and this matter of legislation affords opportunity for much oratory at state fruit growers' conventions, at nurserymen's conventions and at state conventions of county horticultural commissioners.

Continued on Page 370

Figs in Nursery Row

As Fresno has become the center of the raisin industry it is now becoming the greatest fig producing section of the world. Almost the entire San Joaquin Valley is adapted to fig culture. Only a few months ago there was held in the city of Fresno a fig growers' convention, at which varieties, cultural methods and marketing methods were discussed. Since that meeting many fig marketing associations have been formed. This photo was taken in one of the nurseries of the Fresno Nursery Company. There is some difference in opinion as to varieties but the Calimyrna—or Smyrna fig—with caprifigs to supply a home for the blastophaga is being planted more every year.



Kirkman's Truck and Trailer Loads

Grown in other counties and brought to Fresno for distribution.

Some Walnut Trees

George C. Roeding is standing by one year's growth of walnuts. These are fine husky trees and show what a successful nurseryman can do.

Thousands of Apricots of the Fresno Nursery Company

Apricots are in keen demand this year. It is a fruit on which California has almost a corner. Mr. Wilson of the Fresno Nurseries, however, says: "Plant apricots, but plant staple varieties, known and tried." This great field, taken when the trees were in full leaf in summertime, shows how thousands of trees of one variety are grown.

Frost Protection in Citrus Groves

By Prof. R. S. Vaile

Concluded From Last Week

The writer compiled certain figures showing the total effect of the heating practiced on the two nights mentioned in the Pomonoa section. These figures were arrived at by taking the readings of all the available thermometers within the firing area, that is to say, that area which was very definitely cvered by the dense smudge smoke all through the period observed, and a similar set of temperature readings in the districts which were distinctly out of the smudged area. These temperatures have been averaged and show the rise and fall as effected by the smudging. The night of December 25 was one in which there was a rise of temperature commencing shortly after the fires were started even outside of the smudged area. The night of the 26th, on the other hand, showed a fall in temperature up to morning. Table VII. shows a comparison of average readings.

the orchard to retain the heat stored in the fruit, foliage and soil. Even granting that these results have been possible in Mr. Jones' case—and there is no doubt but that it is so—it hardly seems that the saving in labor and convenience will offset the greater cost of oil in adding this moist warm blanket to the air. Take, on the other hand, the conditions of the January freeze of 1913. The temperature throughout the day had been hardly above the freezing point. The amount of latent heat stored in the soil and fruit was practically nothing, therefore the prevention of its radiation would have had little effect in preventing the freezing of the fruit. In such a case every effort would have to be thrown into actually adding heat units.

Why the Wall of Heat is Not Efficient

Theoretically, at least, the production of frost is due in considerable measure to the fact that the heat of the earth

TABLE VII.

Average temperatures, Smudged and Unsmudged Sections, Pomona District, December 25-26, 1916.

Dec. 25			Dec. 26		
	Smudged	Unsmudged		Smudged	Unsmudged
11:30x to 12:50	28.9 deg.	29 deg.	10:30x to 11:30	29.2 deg.	29.2 deg.
1:00 to 2:00	32 deg.	30.1 deg.	3:30 to 4:30	28.8 deg.	27.3 deg.

xFiring commenced about 30 minutes before first reading.

This comparison shows that the rise of temperature over the district as a whole was comparatively small, and it indicates to the writer that too much value has been placed in the minds of growers upon the smoke and not enough attention has been paid to the actual amount of heat added to the air.

Mr. Willis S. Jones of Claremont has worked out a system of firing orchards in which he builds a heavy wall of heat around the outside of his grove and through the grove in both directions at intervals of 16 trees. This system has many practical advantages, such as the ease of lighting and the ease of filling, and continued observations during the past four years have demonstrated that Mr. Jones is able to hold the temperature in his grove not less than three degrees above the temperature outside of his orchard by this system. As Mr. Jones himself states, it is not possible that the temperature of air 180 to 300 feet from the fires could have been influenced by radiation, conduction or convection of heat. He, therefore, lays the effect to the blanket of moist air thrown over the orchard by the heaters, thus enabling

is rapidly radiating to and through the atmosphere, continuing upward to an atmosphere which is very cold and which in turn can radiate practically no heat back to the earth. Therefore the earth must and does lose considerably more heat than it gains and thus cools to a temperature below the adjacent atmosphere. This condition giving a rising temperature with increasing distance from the ground to 300 or 400 feet, is contrary to the adiabatic rule that temperature falls at the rate of 1.6 degrees for each 30 feet elevation, but it makes it possible to protect against frost by the liberation of heat units at low temperatures at or near the earth's surface. For instance, if air warmed to 34 degrees could be liberated all over the ground surface on a still night when the surface temperature was between 30 degrees and 32 degrees, such air would not rise over 30 or 40 feet, while if it were heated to 40 degrees it might rise to 300 or 400 feet in keeping with the adiabatic rule of elevation and the effect on temperature. Theoretically then, with a wall of heat around blocks of orchard, where the temperature is raised to a relatively high point, there must be large amounts of heat units lost to the high atmosphere.

Mr. Mertz on the experiment station property at Riverside has several times during this winter tried out the relative efficiency of lighting only a few pots, say one to every four or six trees, with a fairly large fire as against one for every tree with a much smaller fire, the attempt being made to burn approximately the same amount of oil per acre in each case. There seemed to be no room for doubt in these tests but that the largest number of small fires gave better efficiency in raising the temperature in relation to the surrounding temperature than did the small number of large fires.

Improvement to Be Looked For

One of the greatest objections to the present method of orchard heating is particularly felt in such districts as the Pomona district where the great amount of smudge produced becomes an active nuisance in the towns of the district, and probably somewhat of a menace to health. As indicated above, it is questionable whether the smudge produced in the heating of orchards is in any way necessary from the standpoint of preventing the frost. On the other hand, the difficulty is to get a cheap fuel that will give heat units without the smudge. Many things have been suggested along this line but nothing very practical has as yet been produced. Oils carrying somewhat less asphalt than formerly have been used the last two seasons with somewhat improved results but much is still to be hoped for. The Fruit Growers Supply Company is taking up the matter of fuel oil, ma

Teague Quality Citrus Trees

will all your citrus wants appease

MARCH is an ideal month in which to plant orange and lemon, pomelo and lime trees. The advent of warm weather as the rainy season draws to a close, renders the soil ideal for tree growth. Ideal conditions call for ideal trees, which are the only kind we have to offer, hence are anxious to serve you. Correspondence a pleasure; a telephone message a joy; and a personal interview a delight.

R. M. Teague
Citrus Nurseries
R. M. TEAGUE, Manager
San Dimas, California

rather exhaustive investigations into the question and outlined certain rather rigid specifications for the oil that was to be furnished. When it actually came to placing the orders, however, they found that the important thing and one to which all other specifications must give way was to get an oil that could be handled in large quantities on short notice. For this reason there has been considerable variation in the grade of oil furnished, although the last two years the average has been about 27 degrees or 28 degrees Baume with a five per cent asphalt content.

Conclusion

In conclusion, we would make the following rather definite statements which we trust this discussion has borne out.

It is entirely possible to protect orange groves against frost

Whether or not it pays to protect any certain orange grove depends upon the actual risk, the amount of protecting that would need to be done and the value of the crop to be protected.

More attention should be given to adding heat units than to prevention of radiation by formation of a cloud of smoke.

The improvement in orchard heating which is to be worked for may possibly come from the finding of some better type of fuel, but probably because of practical limitations will have to come through finding a better type of burner.

Mulched Basin System

THE Mulched Basin System of Irrigated Citrus Culture and its Bearing on the Control of Mottle Leaf" is the title of Bulletin 499 of the United States department of agriculture, written by Dr. L. J. Briggs, C. A. Jensen and J. W. McLane, all of whom have been investigating in connection with the citrus experiment station at Riverside. Every citrus grower will be interested in securing this bulletin from United States Department of Agriculture, Washington.

The bulletin touches upon: cultural practices in California, plowsole, organic mulching, basin and cover crop experiments, furrow irrigation, summer cover crops, effect of mulch basins on soil and root, fruit setting, cost of basin mulching, limitations of the system, etc.

From the summary we give:

The present paper is concerned with field experiments relating to the irrigation of oranges and the use of organic fertilizers and deals particularly with a new method of citrus culture. The mulched-basin system, in which low dikes are thrown up so as to form large shallow irrigation basins near each tree, and each basin is heavily mulched with alfalfa hay, bean straw, manure, or some other organic material. The basin makes it possible to supply each tree with water in accordance with its needs, while the water carries with it to the feeding-root system the plant food extracted from this disintegrating mulch.

The system of furrow irrigation and clean cultivation in common use in citrus districts in California tends to promote the formation of a plowsole, or incipient hardpan, below the surface mulch, varying in thickness from three inches to two feet; leads to excessive accumulations of soluble plant-food substances, especially nitrates, at the surface of the soil, where they remain until washed down by the winter rains; and fails to conserve the soil moisture sufficiently to prevent the trees from wilting frequently during the summer months.

The mulched basin system was found to conserve the soil moisture better than any other system of soil treatment compared with it, and none of the basined trees on either light or heavy soils wilted. Under all the other cultural methods employed wilting occurred at some period during the summer on both light and heavy soils.

Available soil moisture below the third foot did not prevent orange trees from wilting if the moisture content in the first three feet of soil fell below the wilting coefficient.

With the amount of irrigation water ordinarily available in these districts (one miner's inch to four or five acres) cover crops of barley or sweet clover can not be grown during the summer months in groves on either heavy or light soils without causing the wilting of the orange trees.

Circular trenches dug around orange trees, filled with manure or alfalfa and covered with dirt, did not remain open sufficiently after the second irrigation to distribute the irrigation water adequately.

In the clay-loam soils the lateral movement of moisture is very slight. In such soils the furrow system of irrigation is inadequate unless a large number of furrows are used, including furrows under the trees.

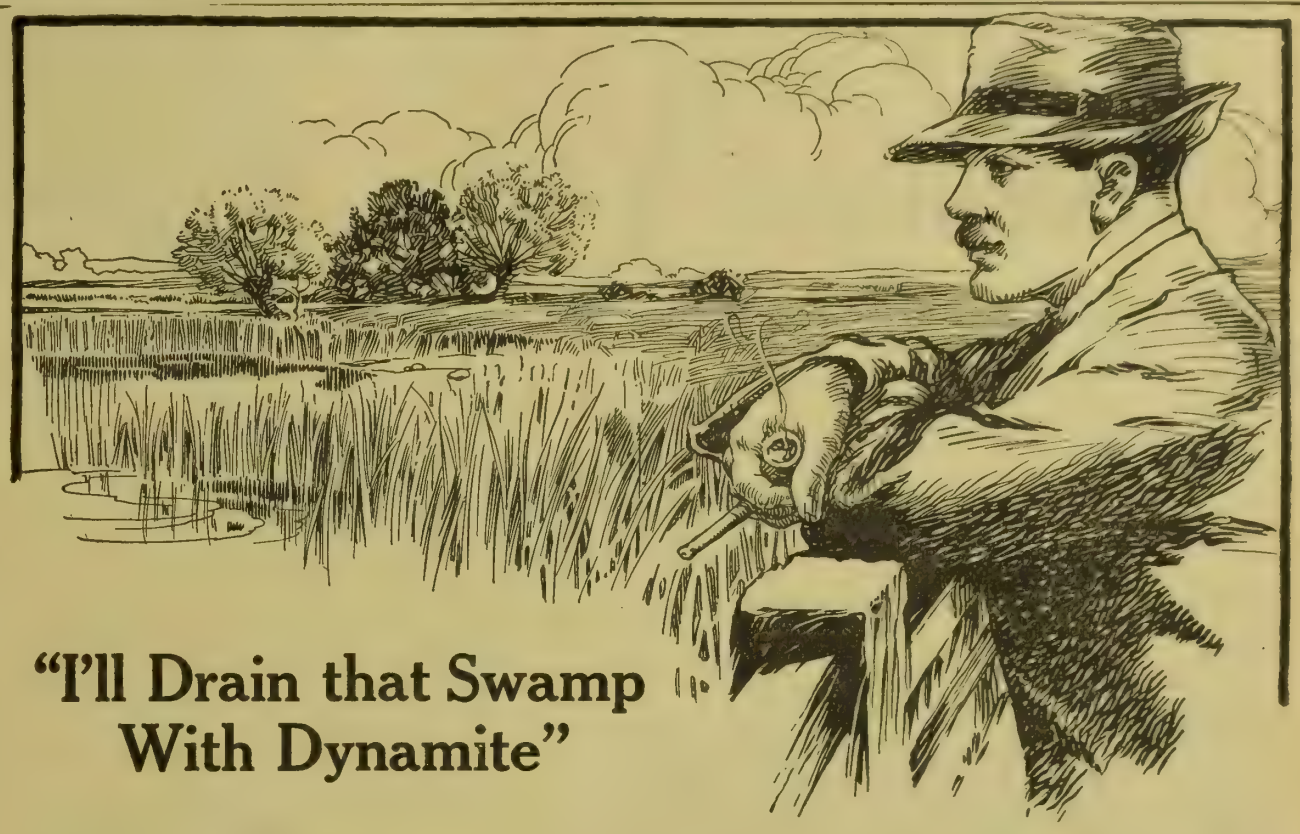
Moisture determinations in groves in which alfalfa was being grown as a permanent cover crop show that the irrigation water never penetrated deep enough into the soil to insure an adequate moisture supply for the orange trees.

For a basin having an area of 150 square feet the experiments indicate that approximately 150 pounds of alfalfa or 15 to 20 cubic feet of stable manure will be required each year to maintain an effective mulch.

It is not possible with the water ordinarily available to grow mulching material between the basins sufficient to maintain a satisfactory mulch on the basins. Cover crops, however, can be grown between the basins on winter rainfall to supply part of the mulch, and where water is available in the summer it can be used for the same purpose.

Orange trees on clay-loam soil responded more quickly to the mulched-basin system than trees similarly treated on light soils, because the heavier soils under the furrow method of irrigation do not absorb moisture as rapidly as lighter soils. Mulched-baisined trees on clay-loam soils showed a marked response to the treatment in three months, while basined trees on light soils required from six to 12 months to show a growth superior to that obtained with furrow irrigation and clean cultivation. The mulched basin is not satisfactory on heavy gumbo soils.

The set of fruit was very light throughout the Riverside district in 1915, owing apparently to cold weather following the bloom. In the Sunny Mountain tract, where the mulched basins were first installed in 1913, the average number of oranges per tree on the check trees in 1915 was 116, while on the mulched basin trees the average number of oranges per tree was 281, or two and one-half times as many as on the check trees. The quality of the fruit on the basined trees was also superior to that on the unbasined trees. In the Victoria tract in 1916 the alfalfa-



"I'll Drain that Swamp With Dynamite"

The man who is familiar with the use of dynamite on the ranch or farm finds that it serves many purposes. Not the least of these is the draining of swamp land.

If there is any low, wet land on your place, land that heretofore has been unproductive, drain it with Hercules Dynamite and make it pay its way. You will find that by using dynamite you can do the work more quickly, more thoroughly, and at less expense than by any other method.

HERCULES DYNAMITE

naturally gives as good results when used for running irrigation ditches as when used in drainage work. Until you have tried it yourself or seen it done it is impossible to imagine how quickly a ditch can be run with dynamite. There is no dig-dig-dig about it. A line of charges is planted—exploded by means of a blasting machine—and there's the ditch. Or if the land is very wet no blasting machine is necessary; simply fire the center charge with cap and fuse; it will fire the next one, and so on down the line.

Oftentimes wet places can be drained with one charge of Hercules Dynamite by shattering the impervious subsoil. This involves even less trouble and expense than ditching.

If you have never used Hercules Dynamite in agricultural work write for our 64 page book "Progressive Cultivation". It is sent free on request. It tells in detail how to drain land; remove rocks, trees and stumps; subsoil; plant trees, etc., by the use of Hercules Dynamite. It is fully illustrated and is well worth reading. When you write please use the coupon below.

Mr. GRAPE-GROWER

It is almost time for MILDEW.

Let us send you an AMERICAN BEAUTY now, and when the time comes to sulphur, YOU will be ready, and YOUR CROPS will be SAFE.

Remember:—"A Puff in Time Saves the Vine."

THE AMERICAN BEAUTY SULPHUR MACHINE

was awarded the BLUE RIBBON and DIPLOMA at the 10th Annual District Fair, at Fresno, Cal., 1916.

It is not an experiment, not an imitation of any foreign device. It is a California product, designed and built in California by practical men, to meet the needs of California and West Coast growers. It is the result of two years' work in field and factory, and has been subjected to the most rigid vineyard tests, under the personal supervision of one of the leading grape-growers of Fresno County.

It takes the sulphur right from the sack, crushes the lumps, passes it through the finest screen ever used, and delivers it in a perfect cloud of fine, clinging sulphur, without waste. You will hear no "BIRD SHOT" rattling on the leaves from this machine. It will cover almost double acreage with the same amount of sulphur because the sulphur is more finely divided.

It works evenly and continuously, from start to finish, and will not choke, clog, nor stop feeding for any reason. One rancher ran sixteen sacks of sulphur through an AMERICAN BEAUTY without trouble of any sort.

Don't lose valuable time tinkering with a poor machine—a few hours lost at a critical time may cost you your crop. Insure success by being prepared.

Send us $11 today, and we will send you an AMERICAN BEAUTY, all charges paid. Try it a week, and if you are not entirely satisfied, send it back at our expense, and we will cheerfully refund your money.

WE FULLY GUARANTEE EVERY MACHINE

mulched trees averaged 483 oranges, the manure-mulched trees 242 oranges, and the check trees 182 oranges. In the Eureka tract, where the mulched basins had been installed the preceding autumn, the alfalfa-mulched trees carried on the average 550 oranges, an increase of 33 oranges per tree over the average yield of these trees for the preceding six years. Experiments in this tract with other mulching materials showed a decrease in yield during the first season, due in part at least to the fact that the new root system below the basins was not established at the time the fruit buds were set.

The new leaf growth on the basined trees was less mottled than the new growth on the unbasined trees after sufficient time had elapsed for the mulched-basin system to produce response in the tree growth.

The new leaves on the basined trees were larger and darker in color and had a better texture than those on the unbasined trees, especially on heavy soil.

The new growth of rootlets under the mulch in the basins was very much greater than in the check treatments, the soil in the basins being filled with rootlets to within about two inches of the surface.

Great numbers of earthworms were often found in the basins under the mulch, and their burrows honeycombed the entire soil mass. The worms help to incorporate the organic material with the soil, while their burrows facilitate the absorption of water in heavy soils.

No soil crust of any kind has been found in the basins where the mulch completely covered the soil surface. A complete mulch must be maintained at all times, however, to prevent the surface from crusting.

The experiments indicate that alfalfa and bean straw are superior to stable manure for mulching purposes.

In the mulched basins the quantity of humus, as measured by the intensity of the color of the alkaline extract, increased markedly in the first foot of soil buring the summer, but no increase was observable at the greater depths. From 70 to 120 days were required for the mulch in the basins to decompose sufficiently to produce a measurable increase in the humus content. Alfalfa and manure mulches were equally effective in producing this increase in humus. Barley cover crops produced a marked increase in the humus content of the soil 50 days after being disked into the soil.

The use of an organic mulch moderates the rise in soil temperature during the day. The advantages of the mulch, however, are not wholly attributable to this fact nor to the conservation of moisture. Wood shavings when used as mulching material afforded as much protection in this respect as alfalfa or bean straw yet trees mulched with pine shavings gave yields less than half those obtained with mulches of alfalfa or bean straw.

Surface mulching with organic material, especially when available in quantities sufficient to cover the entire surface, may in the long run prove fully as effective as the use of the mulching material in basins. A more immediate response from the mulched basin may be expected, however, owing to the fact that each time the basins are flooded the soluble portions of the decaying mulch are carried with the irrigation water directly into the soil. In this respect the mulched basin resembles a surface organic mulch in humid regions where the rainfall first passes through the mulch before entering the soil. Many of the citrus soils of California contain so little active organic matter that it is essential to secure the advantages of the applied organic material at the earliest possible date, and this appears to be brought about more quickly by the use of the mulched basin than by organic mulches with furrow irrigation. The mulched basin also appears to be the most effective means of using a limited quantity of mulching material.

The marked response of citrus trees in the experimental tracts under the mulched-basin system justifies its serious consideration by citrus growers. It is still in the experimental stage, and its suitability to local conditions in any instance should be thoroughly tested in an experimental way before installing basins on a large scale. Its final value in the industry can be determined only after it has been so tested in comparison with other systems in commercial practice.

Selling a Good Bill of Nursery Stock

At the reader's right is Wm. Kirkman just after he has sold a large bill of stock to James Mills, the gentleman with the overcoat.

Roeding's Palm Sheds

George C. Roeding standing near center of picture looking at the immense stock of palms ready for delivery. Many of these are boxed and large enough to give the place in which they are established an old-time look.

Mildew of Vines

Written for California Cultivator

OIDIUM, or powdery mildew of grapes, is a disease well known to every vineyardist. The ease with which it is controlled is known to many a vineyardist but not to as many as it should be. A high grade of sulphur applied either wet or dry does the work, if applied at the right time. Good sulphurs are now to be had but the purchaser must be sure he gets the sublimed or highest quality.

In dry sulphur application the use of coarse meshed sacks or perforated cans of pepper box type is expensive, even wasteful of sulphur. The blower or dry sulphur "spray" is now a complete success, and it is claimed that with its use four to six pounds of sulphur per acre is sufficient.

In "Oidium, or Powdery Mildew of the Vine" by Bioletti and Flossfeder we note:

"Mildew on most varieties can be controlled cheaply by proper sulphuring, even under unfavorable conditions in the interior valley.

"It is probable that it can be controlled on all varieties by the same means in the same region.

"The presence of missed or untreated vines much increases th difficulty of controlling the disease on all the vines.

"Winter treatments are unnecessary and useless.

"Wet sprays are more expensive to apply, and that tested less effective than dry sulphur. It is probable that other wet sprays would be no more or even less effetcive.

Number of Sulphurings

"The number of times it is necessary to sulphur will depend on the locality, the variety, the season and the sources of infection and will vary from one to six. In the interior valleys two will usually be enough if the work is done regularly and properly in all the vineyards.

"The first sulphuring should be done when the shoots are not more than six or eight inches long. Later, the foliage becomes dense and it is difficult to cover every part of the surface with sulphur: At the first sulphuring it should be possible to see daylight through all parts of the vine."

"The first sulphurings are preventive and are the most important and effective. If we wait until mildew is perceived, the cost of control will be much greater and it will often be impossible to control the disease completely.

"The second sulphuring should be given during or just before blossoming. At this time the interior of the mass of foliage will be dense in places, but the first sulphuring has already covered the parts which might escape the second. With Muscats and most fine grapes these sulphurings will usually give perfect control if there are no summer irrigations and no untreated vines or parts of vines in the immediate vicinity. With very susceptible varieties, such as the Carignane, or excessively vigorous growers, like the Emperor, or where summer irrigation is practised, a third sulphuring may be necessay about the time the grapes are half grown. Only imperfect work or abundant reinfection from untreated vines should necessitate more than three treatments except in the coast regions of summer fogs and even here three will usually be sufficient.

INCREASE IN FRUIT ACREAGE

Reports received from many counties by the state commission of horticulture show a remarkable increase in acreage planted to trees and vines last month in California.

Top notch prices and large unfilled orders for many varieties of fruits have served to stimulate an increased interest in the fruit industry, the natural result being more money, labor, and acres devoted to plant life than ever before. Furthermore on account of fair pices orchards are receiving better care than usual. For example: Madera County planted 84,924 trees during February exclusive of several hundred thousand cuttings, the major portion being peaches, apricots and figs.

Yolo County 72,030 trees, with almonds in the lead. Large increase in all fruits.

San Luis Obispo County 65,050 trees, also shows almonds holding first place. Total increase here more than 30 per cent.

Kings reports an excess of 109,000 trees and plants; apricots ranking first, prunes and peaches following in order mentioned.

Yuba County: 385,316 trees, vines and plants were received for planting, prunes leading other trees.

Many other counties not yet reporting have shown a phenomenal gain in acres planted this year.

SPRAY FOR APPLES

At one time former Commissioner Volck of Santa Cruz County issued a bulletin giving special spring treatment for apples. This treatment provides both insecticide and fungicide and is perhaps as economical as one could ask considering its double purpose. The formula is: For Newtowns, Bellflowers, Gravensteins and most other varieties:

Iron sulphide, dry basis, 8 pounds; zinc arsenite, 6 pounds; or acid arsenate of lead, 16 pounds; or neutral arsenate of lead, 20 pounds; water, 200 gallons. For aphids add "Black Leaf 40", 1 to 2 pounds.

The arsenical poisons are rated here in the order of their efficiency in controlling the various caterpillars which are troublesome in the early spring. It must be remembered, however, that zinc arsenite or acid lead arsenate may cause injury if the application is made too late. The proper time for the application of zinc arsenite is full bloom, and the spraying must not be materially delayed beyond this time. When properly timed zinc arsenite is the most satisfactory arsenical for the first spraying.

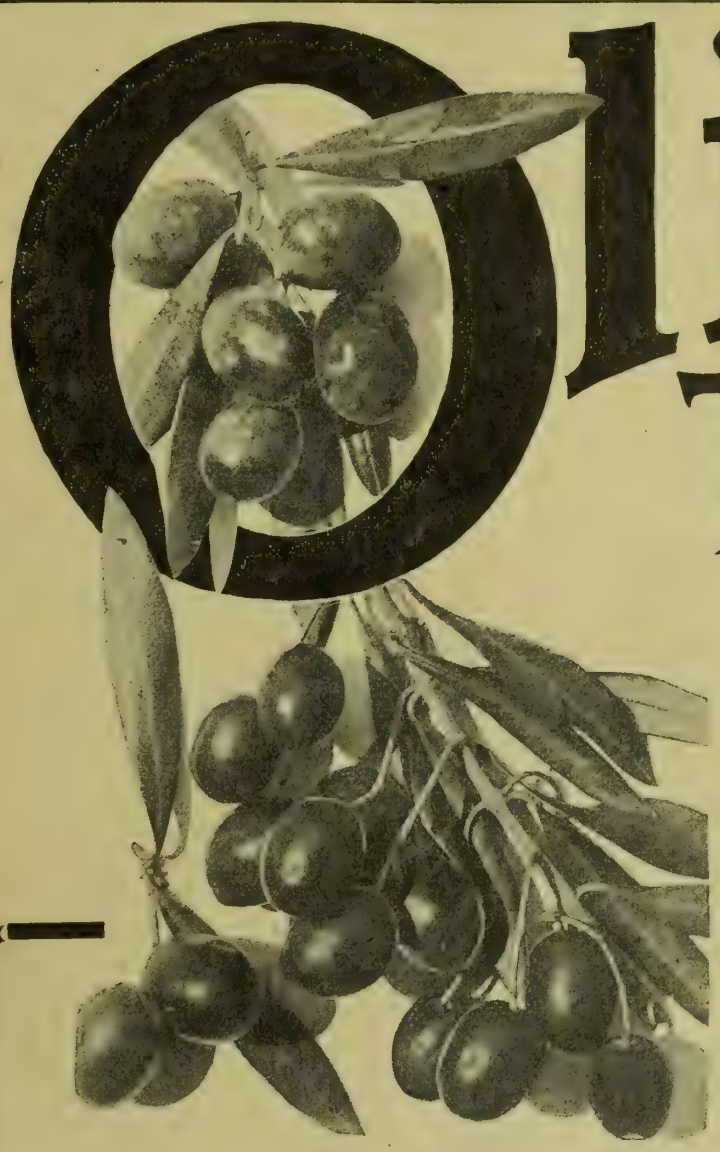
Iron sulphide is a very important part of the spring sprays. It serves two purposes, namely the control of apple mildew and the strengthening of the foliage so that arsenical poisoning will not be so likely to occur.

FRUIT PLANTING IN SAN LUIS

Practically no nursery stock being grown in San Luis Obispo County, and the inspection of nursery stock being practically over, Horticultural Commissioner S. V. Christierson, estimates that the following acreage will be planted in the county this spring, such estimate being based on total number of trees inspected, and an average of 70 trees being planted to the acre: Almond 2565, pear 800, prune 554, apricot 279, peach 147, apple 82, mixed varieties 67, walnut 11, cherry 12, grapes 10. Total 4547. This total is to date better than 125 per cent over the estimate made by the commissioner before shipping season commenced and will increase the county's acreage of fruit and nut trees 44.7 per cent.

One of the best ways to solve the labor question on the farm is to make the farm so attractive that the young folks will want to stay there, and the way to do this is to keep the farm home just as well supplied with modern improvements as the city home. Give the young folks an opportunity to enjoy life on the farm equal to the opportunities they find in the city.

Ten carloads of lettuce were shipped out of Brawley last Sunday.



Olive Trees

Read This Letter from the Secretary of the Los Angeles Olive Growers' Association

Los Angeles, Cal., March 14, 1917.
Fancher Creek Nurseries,
Fresno, California.

Gentlemen: I desire to write you and express my views of the present situation relative to the Olive Industry, and would say that at the present time there is more demand for the products of California Olives than at any time in the past history of the State of California. It would be possible today to sell for delivery out of the next crop, which will mature in November and December, three or four times the amount of the visible supply and at prices which would render the grower a good return upon the money invested and labor employed. The former consumers of the Imported Green Olives have more rapidly during the past twelve months turned their attention to the California Ripe Olives, than in any similar period of time ever before experienced. It is reasonable to believe that after they once become accustomed to the California product, they will never revert to the Green Olives, on account of the superior food values to be obtained through the use of the California Ripe Olives.

The Industry looks encouraging for the reason that it provides a product that can be put up in cans, so it is not at the mercy of the market, the same as a perishable article would be. Those looking for a product upon which they may reasonably expect an advanced increased consumption can make no mistake in selecting California Ripe Olives.

Yours truly,
FRANK SIMONDS,
Secretary.

— There is a shortage of Olives in California.

— California Olive Oil is practically all sold out.

— There is a strong demand for California Ripe Olives.

— Prices for trees are lower than they probably will be next season.

— The next five or six weeks are ideal for planting.

— We have a magnificent stock of Manzanillo, Mission and Ascolano, which are the three best varieties to plant—all propagated from bearing trees in Mr. Roeding's orchard.

— Special quantity prices on application.

Autumn Flowers

Written for California Cultivator By E. Braunton

THOSE who are looking forward to a fine crop of autumn flowers should act now and be rewarded an hundredfold when the cool days of October and November come. Asters will come first and reign from September until autumn's floral queen, chrysanthemum, becomes the reigning flower late in October and on to the yuletide.

Aster seeds should be sown now in boxes of light sandy soil not less than three inches deep and kept in a shady and somewhat protected spot until the last plant is well up. The one point to remember about asters is that from the time the seeds are sown until the flowers are picked the soil must never be allowed to get dry yet should not be kept saturated with water. Young plants may be set out in boxes two or three inches apart each way when quite small, about a half inch to an inch high and transplanted to permanent position when four inches high, or they may be left in seed bed until two inches high and then shifted to place where they are to flower. The method first given is the better for then plants may be partially shaded until well established and finally transplanted with a small square of soil so they will suffer no check in growth as a result of moving.

Chrysanthemums should be handled now from the old clumps of last year. If you merely wish to divide, break clumps up into the smallest pieces possible. If but one good shoot remains to each bit it is enough. Plant these where they are to grow. As they will be early they may grow too tall unless pinched. Therefore keep tops pinched back whether from divided clumps or grown from cuttings but never pinch or cut down later than July. Give a richer and heavier soil than for asters and use any and all kinds of fertilizers more freely. Still, do not crowd plants too fast; there is plenty of time for the best and fullest growth and forcing should be reserved for later days.

All professional growers and those who get best results propagate each spring from cuttings. From the old clumps take four-inch cuttings of good sturdy firm growth. If the terminal leaves are large so as to be in the way or draw too heavily on the sap in the cutting, snip off the upper half. Put cuttings in a box of sharp sand three inches in depth with cuttings never less than one inch down in sand. Keep in cool shaded place away from winds. Always use a very sharp knife, for the cuttings must not be bruised. Never force them into sand but make holes or slots in sand so they will go down freely, but press sand firmly about them and settle it by a good thorough though gentle drenching. The young plants should be ready for transplanting to field in about six weeks. Some plant them a foot apart in row and rows two feet apart, but spacing should be governed by experience and the training you expect to give. If plenty of space is available put them one and one-half feet apart in the row and rows three feet apart. Subsequent culture will be outlined in future issues to keep pace with expected growth and development.

Near-Eucalypti

We have a family of shrubs that came from Australia and have become strong favorites in all parts of California. They are splendidly drouth-resistant and seem to thrive in all kinds of soil. Have observed them closely, I would advise, if but one sort is to be planted, to use Leptospermum laevigatum. The other species introduced locally are four: coccineum, lanigerum, scoparium, and stellatum. No use to seek all the species of shrubs mentioned in this department, for though I have seen all of them and have photographs of all, no dealer has them all, but the species recommended is always easily found in plant depots.

Fine Shrub Group

In local plant depots there may be found a splendid group of shrubs known to botanists as cotoneaster (co-to-ne-as-ter). Eight species have been introduced to California, as follows: acuminata, angustifolia, frigida, horizontalis, microphylla, pannosa, Wheeleri, and thymifolia. All are good, all do well in California, but the best of the lot in my opinion, is pannosa. In the southern end of the state it is nearest a true evergreen of any of them, flowers freely, and sets a heavy crop of brilliant red berries.

Value of Trees

The Los Angeles County board of forestry now has a suit pending against a land owner who cut down some fine old trees on his lot frontage. The question of values arise at the outset. What is the value of a street tree and upon what basis shall it be computed? The first considerations is association. If trees destroyed formed members of a line uniformly planted to one species and of large size, the value is great.

Next comes the kind of tree and along with it the most important matter of location. If tree or trees are on unimproved streets where they would subsequently have to be removed, or if improvements would either fill in about them or leave them well above grade, their value is little, no matter how fine the trees.

Divide Perennials Now

Do not neglect longer to divide and replant clumps of flowering plants with perennial roots. They will flower much better after division even if placed in ordinary soil. But in rich soil they will produce better crops of better blossoms for several years to come. Re-divide from three to five years after each planting, according to rapidity of growth.

Useful and Ornamental

Once again we beg of you to consider evergreen fruit trees, shrubs, vines, and lesser plants when improving the home grounds. Many gardens are filled with trees that have only ornamental value and even this in less degree than the avocado, loquat, guava, feijoa, carissa, and a host of others. Cut the high cost of living down by growing fruiting ornamentals.

What to Plant

The most perplexing question that confronts the intending planter is: "What shall I plant?" It is well to be guided by the experience of those who have planted. Yet do not go too far back for advice for it is said that the first thing Adam planted in Eden was his foot, which is too heavy for the josher "in lighter vein". Observation is the keynote to success. So variable are the soils of our state and so variable are local climatic and other conditions that even the most expert are at times nonplussed. Therefore lean on the experience of others in your neighborhood and study the matter closely yourself.

Try Blasting in Your Garden

By J. R. Mattern

IN most states there is a lack of experimental work on blasting the soil to secure intensive tillage. There is no need of anyone's waiting for the state to decide whether or not this practice is of value in any particular soil, because to do some of the blasting costs only a dollar or so. If the blasting is done when the ground is dry there is no possibility of harm resulting any more than there is from plowing or harrowing.

Blasting of soil is nothing more than intensive tillage that reaches three or four feet into the ground. Nowhere is intensive tillage more needed than in gardens. Pick out a time in late May or in June or July, this summer, when the ground is dry (the drier the bet

ter), and place small charges of farm powder two and a half, three, or four feet deep, and six to 15 feet apart. You want the charges so placed, and of a size so that they will not blow out, but will only heave or swell the surface over each shot and reach all the ground between.

It will not hurt the growing plants to blast right under them when the ground is dry. If the blasting can be done just before a hard rain the blasting will produce more immediate benefits than if rain does not follow soon. If you prefer to wait till the crops are off do the work in late August or September before the fall rains arrive.

One good blasting in a garden should be of as much good as a dozen thorough spadings to a depth of 15 inches. For field and orchard crops the same intensive tillage is equally as valuable, and you can find out all about it for yourself by trying small plots in representative parts of the fields. One 50-pound box of farm powder ought to more than subsoil an acre, and if you divide the acre up into several small experimental corners, where you have corn, potatoes, grass, trees, wheat, etc., and watch the results carefully, you should have some valuable data in your possession before long. Bear in mind that, as with any other sort of tillage, the results are not immediate but come about through the lapse of months and seasons. If you can get leguminous cover crops planted in the fall on the blasting ground the benefits will be very much larger in proportion.

TO POTATO GROWERS

George P. Weldon, chief deputy horticultural commissioner, is now in receipt of a letter from Lou D. Sweet, president of the Potato Association of America, in which he gives the result of investigations made by that society, as follows:

"On the first of March there were about 1200 cars of potatoes left in Oregon, Washington and California, 1,000 cars in Idaho (half of which are still in the hands of the growers, and the balance in storage because shippers have been unable to get cars to move them), and about 600 cars in Colorado.

"When you stop to think that there are less than 3000 car loads of potatoes west of the Missouri river, you will realize that many of the people will have to get along on short potato rations. Seed potatoes will be very high, and no doubt a large percent of those planted this year will be culls that are more or less infected with disease, and few people will treat with corrosive sublimate as they should, so I am fearful that the quality of potatoes grown in the United States this year will go down ever so much."

Senate Bill 197, now before the Colorado legislature, already approved by the assembly of that state, would prevent, according to Mr. Sweet, "California early potatoes that are infested with the tuber moth from coming into Colorado." Therefore, it behooves the grower to exercise great care in the selection of seed potatoes.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Chick Problems

Is the common wild yellow mustard fed to hens? What makes baby chicks pick toes when they are comfortable and have everything, including gravel and chaff on floor? They have charcoal, bran, chick feed, milk and fresh water, also greens hung so they can pick them. Some one told me they need salt. If so how much should I feed to 100 chicks and how should it be fed?—Subscriber, Saratoga.

Yes the common field mustard is used, but it should be fed before it blooms, else the leaves are tough and bitter. I have read somewhere of salt being fed as a remedy for toe-picking, but this vice is generally attributed either to lack of animal food or exercise. If you feed salt use just a little mixed in the dry mash, rather less than you would use in salting mush for the family. I should not salt a large quantity of the mash, for salt is something that must be used with great discretion, if at all. My own theory is that toe-picking, which seems to be a vice of Leghorns exclusively, or at least of the Mediterranean breeds, is due to lack of employment. The Leghorn chick is a very lively little creature. Confine a lot of them in a brooder with nothing to do but eat and they will try to eat everything in sight. Let them out where they have all the room they want and green things to pick at and they will never think of each others' toes. I have never seen any other breed do this, no matter how they were fed. Sometimes a feeding of cooked lean meat, chopped fine, once a day keeps confined chicks from toe picking, and sometimes it can be controlled by keeping them on deep litter, which hides the feet, but the easiest and surest cure is to let them run. These chicks, however, should have a mash containing meat, preferably a good grade of beef scrap. Equal parts by measure of bran, middlings and feed meal, with from one-half to one part beef scrap, is a good formula for growing chicks.—J. A. K.

Feed for Pigeons

What is best feed for pigeons so as to have no waste of grain?—Subscriber, Hermosa Beach.

Wheat, corn, Canada peas, kafir, German millet and hemp are the staples for pigeon feeding. The corn should be cracked. Other grains are fed whole. All should be of the best quality and thoroughly cured. A good balanced ration is the following: Morning feed, equal parts by measure of sifted, cracked corn, wheat, Canada peas and kafir; afternoon feed, the same with the addition of one part millet. Twice a week hemp is substituted for millet in the afternoon feed. About a quart and a half to a pen containing 50 pairs of pigeons is the normal quantity of grain at a

$1150 F. o. b. Racine

120-inch Wheelbase

Mitchell SIXES

$1460 F. o. b. Racine
7-Passenger—48-Horsepower
127-inch Wheelbase

Mitchell Junior—$1150
Now Added to Mitchell Line

Many buyers prefer a 5-passenger car. Such a car has ample room with a 120-inch wheelbase. Few such cars are that long. And a 40-horsepower motor gives them ample power.

To meet that demand we build Mitchell Junior, which sells for $1150. It is our big, 7-passenger Mitchell in a little smaller size. So you now pay only for the room and power you need.

Saving Every Waste

Note how John W. Bate, our efficiency engineer, is saving every waste. These two Mitchell sizes form a new example.

He has built and equipped here a model plant, which now covers 45 acres. It is designed to build the Mitchell at the lowest factory cost. About 98 per cent of the Mitchell is built under his methods. Our factory cost has been cut in two.

Our new body plant this year brings another big saving — hundreds of thousands of dollars. Nowhere else in the world could a car like the Mitchell be built at so low a cost.

Extras That Result

These savings show in Mitchell extras. There are hundreds in the car.

There are 31 features which nearly all cars omit. And each is a thing you'll want.

There is 100 per cent over-strength in every vital part. Over 440 parts are built of toughened steel. Many parts are oversize. Steering and transmission parts are built of Chrome-Vanadium. The gears we use are tested for 50,000 pounds per tooth.

There are springs which never have broken — the Bate cantilever springs. In two years of use, on many thousand cars, not a single leaf has broken.

There is beauty and luxury which few cars can afford. This year alone we add 24 per cent to the cost of finish, upholstery and trimming. Our new body-plant savings pay that.

See These Extras

Before choosing a car for years to come, learn what these extras mean. See the 31 features—like a power tire pump—which hardly a car includes. See the beauties and luxuries which distinguish the Mitchell.

The vast over-strength, in all probability, means a lifetime car. It means safety, low upkeep, small repairs.

See what Mitchells give as compared with cars built in wasteful ways. The facts are bound to win you to the Mitchell.

If you don't know our nearest dealer, write us for his name.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.
Price $1460, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines, with 120-inch wheelbase. A 40-horsepower motor—¼-inch smaller bore than larger Mitchell.
Price $1150, f. o. b. Racine

Also all styles of enclosed and convertible bodies. Also demountable tops.

POTATOES

9 4-5 Bushels from One Pound of Seed

Three potatoes, planted in 56 hills in Huron Co., Ohio, yielded this amount. The seed, the planting, and the crop harvested are matters of county record. You can do as well or even better by following my instructions. It is not a matter of variety of seed, or soil, or fertilizer used, important as each of these matters is, but it is the selection and cutting of seed and treatment. It was these elements that enabled me to produce the yield of 552 lbs. of potatoes from one pound of seed. Full information as to how it was done, the seed used, the soil, the fertilizer employed, the tillage and the methods of producing this large crop will be sent for One Dollar. Send your order now and grow more potatoes from less seed. Any one who feels too poor to spend a dollar to learn how to increase the yield in raising potatoes send me your name and address. Planting time is near. Send your order today and raise more potatoes from less seed.

A. R. Gibson, Brookfield, Ill.

meal, but the amount depends somewhat upon the number of squabs in the nests. A good rule is to watch the feeding trough. If a little is left after the feeding give less next time. If it is eaten up clean give a trifle more to make sure that the squabs do not go hungry. They have to depend on what the parents bring them, and if there is a shortage in the supply the older birds may feed themselves and let the squabs go without. Such treatment never produces plump squabs in four weeks.—J. A. K.

R. I. Reds

Where and how did the Rhode Island Red chicken originate? Was it from crossing several different breeds, and what were the crosses?—Subscriber, Madera.

The Rhode Island Red, it is generally believed, was developed from successive matings of Red Malay cocks with mongrel hens. The farmers of the Little Compton district in Rhode Island were accustomed to purchase these cocks and probably some others of Asiatic origin from sea captains who had picked them up on their voyages. They were mated to any sort of hen in the beginning, but mating the progeny of these miscellaneous matings back year after year to the same kind of cock bird finally developed a very prolific and increasingly popular breed.—J. A. K.

Carob Beans

Please advise if carob beans are grown on a commercial scale. Will they grow where there is heavy frost in winter? Where can the seed or young trees be purchased? If subscribers of the Cultivator have tried raising these for cattle or horse feed would like information as to yield, rapidity of growth of tree and whether stock will eat the beans readily.—Subscriber, Nordhoff.

There has been considerable interest in the carob. Waste hillside lands too steep for tilling have been planted. We do not believe anyone has used valuable tillable lands for growing the carob for stock feed. An excellent article on the carob was written for Cultivator readers by Horticultural Commissioner C. W. Beers of Santa Barbara County in the issue of April 9, 1914.

Lime-Sulphur Spray for Walnuts

Please say whether it will be injurious to walnut trees to spray with lime-sulphur after they have begun to leaf. Also whether the spraying is unquestionably effective for the control of the aphis? My neighbors do not intend to spray, and while I favor spraying I do not care to go to the expense unless I am quite sure of results. Can you give me the probable cost of spraying large walnut trees per tree or per acre? Can you give me any information as to where I can obtain lady bugs? Do the large, successful walnut growers, like J. B. Neff, spray their walnut trees? Has the experiment station issued any bulletins on this subject? We have the bulletin on walnut growing issued five years ago, but there is very little information regarding spraying.—Subscriber, Halcyon.

Lime-sulphur is not a safe spray to use on very tender growth but can be used if diluted with about 60 parts of water to one part of the stock solution. The best success in spraying walnut trees to control aphis has been by use of nicotine sprays combined with dissolved whale oil soap. A solution made of one pint Black Leaf 40 and four pounds whale oil soap to 200 gallons of water and sprayed on with 160 to 200 pounds pressure, using an M.A.C. nozzle, gave better results than any other combination. This will cost about one cent per gallon and it will require 35 to 50 gallons per tree having 30 to 40 feet spread of branches with the average height. Spraying has not been generally practiced by any walnut growers for the reason that it is not needed in some years and that it is not possible to get the apparatus and spray large orchards in the short time after the aphis appears in large numbers and the time when the damage is done. Some work has been done by the experiment station to determine methods of controlling the walnut aphis but there is room for much more investigation. Circulars No. 66, No. 107 and No. 131, relating to spraying walnut trees have been issued and can be had by addressing Director of Experiment Station, Berkeley, California.—J. B. N.

Weevil

I am sending beans filled with holes in which are insects. The beans have been stored since last year. What are these insects? Some of the beans are almost entirely destroyed.—Subscriber, Lamanda Park.

This is the common bean or pea weevil. When the beans were stored away they should have been treated with carbon bisulphide. Notwithstanding this many of these beans will grow where the weevil have not eaten into the germ. However, we would advise the carbon bisulphide treatment. We send copy of the Cultivator giving method of treating.

Snuffles in Rabbits

Can you advise what ails my rabbits? They appear to be dopy, watering at the mouth and some of them sniffle. Would like information as to the care of rabbits and their ailments.—Subscriber, Palm City.

This may possibly be slobbers, which often affects the youngsters. Clean and thoroughly dry the hutches and give twice daily a teaspoon of the following mixture: To a tablespoon of powdered ginger and a tablespoon of chlorate of potash add eight ounces of water. There is a possibility, however, that the trouble may be snuffles, which is more serious. The affected animals should be removed from the others and fed every other day lukewarm milk to which a few drops of sweet spirits of niter has been added. This disease is contagious and care should be taken to keep the healthy and diseased animals entirely separate when seriously affected.

Rose Scale

I enclose part of berry vine. Kindly advise what the trouble is and remedy for same.—Subscriber, Visalia.

This is the ordinary rose scale and may be controlled by spraying with almost any of the contact sprays. Lime-sulphur, if applied at once around the base and lower parts of the vines, will probably prove sufficient. Kerosene emulsion will also prove effective. We have even known of beneficial results from throwing on the canes of the vines a very strong stream of water. This will knock off many of the insects.

Worms

Please tell me cause and cure for worms in the flesh of chicken's gizzards.—Subscriber, Orosi.

Three varieties of parasitic worms inhabit the crops and intestines of domestic fowls. Round worms are from 1½ to 3 inches long, and very small, tapering at both ends. Tape worms, which are less common, are found in flattish segments, one of which, the head, attaches itself by hooks or suckers to the walls of intestine or crop. The third variety, which is known by the name, fluke, is small, flat and usually oval. Round worms,

all kinds of Nut Culture, discussed by experts. Official Journal. Highly endorsed. $1.25 a year; 3 years $3. Sample copy 15c. 39 State St., Rochester, N. Y.

Those who do not read the advertisements in the California Cultivator will miss a lot of useful information.

which are by far the most common, are passed from fowl to fowl in the droppings; tape worms are supposed to come from eating slugs, snails or earth worms; flukes no one seems to know much about, and they are of no importance, for they do not affect the health of the birds.

The chief drugs used for tape worms are extract of male fern, pumpkin seed, pomegranate root bark, turpentine, powdered areca nut and male fern. Either of these is best given while the bird is fasting and should be followed by a dose of castor oil two to three teaspoons). The dose of turpentine is one to three teaspoons; of areca nut, 30 to 45 grains mixed with butter and made into pills; of pomegranate root bark one teaspoon for 50 birds. The pumpkin seed may be chopped and the birds allowed to eat all they will. Male fern, which is considered one of the most effective remedies, may be used either in the form of powder (dose 30 grains to one dram) or of liquid extract (dose 15 to 30 drops). It is given morning and evening before feeding.

You will have to decide by careful examination to which class the parasites belong before you treat them, for remedies which are successful with one sort have no effect on the other. If they answer the description given above for round worms, and the birds seem sickly or unthrifty, you might try the tobacco treatment recommended by the experiment station at Berkley, Circular 150, which costs nothing and ought to be in the hands of all poultry raisers, gives full description of these worms and directions for treatment, which is briefly as follows: For 100 birds steep one pound finely chopped tobacco stems two hours in water sufficient to keep them covered. Mix this liquid with ground feed sufficient for half the usual feeding. Put the birds on half rations the night before and on the day of treatment feed nothing till 2 p. m., when the medicated mash is given. Two hours later give half as much mash made with water in which Epsom salts (11 ounces to 100 birds) has been dissolved. Repeat in seven days. Chicks may be treated in the same way, the amount of mash being in proportion to age.—J. A. K.

Permanganate for Roup

Would like to ask you a question concerning potassium permanganate as a cure for roup. Several of my Leghorns have it, and I have been dipping their heads in warm water in which has been dissolved the permanganate, as per J. A. K.'s advice on page 97, January 27 issue of California Cultivator. What effect does this have on the disease and should it be repeated each day until a cure is effected?—Subscriber, Folsom.

Potassium permanganate can hardly be called a roup cure. It is an antiseptic, and its main virtue is that when used as recommended, the head of the bird being held in the solution for a few seconds, it washes out the nostrils and eyes, ridding them of the secretion and giving nature a chance to do her own curing. The treatment should be repeated morning and evening, the solution being prepared fresh each time till all symptoms have disappeared. In light cases a few days' treatment, if the bird is in sunny, dry quarters, will usually effect a cure. In severe cases, where there is high fever and depression, or where the disease attacks the throat or forms deposits of cheesy matter below or about the eyes, it is of little if any value. In the case of cheesy deposits the only treatment seems to be to open the swellings and remove the deposit, afterward washing with peroxide of hydrogen or a five per cent carbolic solution. The permanganate treatment is recommended because it is the cheapest and easiest. If massage is applied to the nostril before the head is submerged, the operator pressing upward several times with thumb and forefinger to loosen the discharge, and then the head kept under as long as the bird can bear it, the treatment usually has excellent results. It must be remembered, however, that no treatment for roup will have lasting results unless the cause (dampness, filth, exposure, overcrowding, poor ventilation or draughty roosts) has been removed.—J. A. K.

COMPLIMENT TO CALIFORNIA'S HORTICULTURAL COMMISSION

"The service of the supervision of fruit orchards concerning injurious insects and plant diseases has been remarkably well organized under the general direction of the horticultural commission, and we must admit that in this respect no country on earth is better protected."

With this direct and forceful comment, Dr. Paul Marchal, distinguished authority of the National Agronomical Institute, Paris, pays tribute to California's horticultural commission in his recent work, "The Biological Sciences Applied to Agriculture, and the Struggle Against the Enemies of Plants in the United States."

Dr. Marchal was in California the guest of Dr. Howard, chief of the bureau of entomology, United States department of agriculture, and through the efforts and solicitation of Dr. Howard the eminent authority was authorized to make a study of horticultural conditions in the United States for the Carnegie Institute.

The book is thoroughly comprehensive and crisp and unerring in detail. Dr. Marchal, in grasping so quickly the conditions in California, is entitled to unstinted credit. First he depicts the magnitude of the fruit industry in the state, and then pictures in a vivid manner the process of protecting this vast asset from the ravages and pests peculiar to various trees and vines described.

George P. Weldon, the entomologist and horticulturist, H. S. Smith, of the insectary, the commissioner and those interested in the field work in the various counties are all complimented for their successful team work.

It is plain that Dr. Marchal was interested in the work of gathering and distributing the Hippodamia convergens, or ladybird. Other insects calculated to destroy pests peculiar to the fruit industry are also listed among the features of the work.

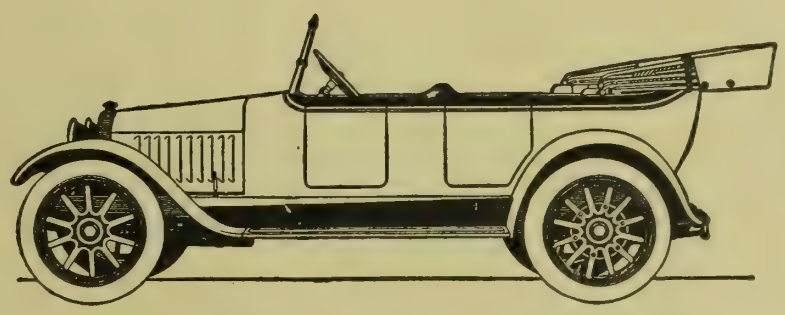
Apparently the successful effort to control the San Jose scale by means of lime-sulphur treatment appealed with particular force to Dr. Marchal, for in paying another compliment to the commission, he says: "It is also due to this same organization that one is able, after a comparatively brief period of experiments, to be master over such a redoubtable pest as the San Jose scale."

Many compliments are paid the work of the quarantine division of the commission, under the efficient direction of Frederick Maskew, chief quarantine officer, and attention is called to the theory of applying a preventive in order to avoid troublesome conditions.

NO CITRUS CANKER

G. H. Hecke, state commissioner of horticulture, feels a decided relief since he received word that samples sent to the pathological station did not show evidences of having citrus canker.

The appearance of these samples sent the commissioner from Southern California indicated the presence of canker. Fearing that it was this, no time was lost in forwarding them to Florida where experience with the disease has made the growers and horticulturists familiar with it. Strict quarantine regulations are in force to protect the citrus growers of California, and orders have been sent out that these regulations must be rigidly observed. Only by drastic methods and eternal vigilance can the canker be kept out.



Chalmers 7-Passenger Touring Car—Price $1350 Detroit

Full Value for Every Dollar

In this Chalmers, 7-Passenger Touring Car

Scan the list of other 7-passenger cars for the equal of this Quality Chalmers. You will not find it. Only in this Chalmers are combined so many real values. You may pay $300 to $500 more and find nothing better.

Only a builder of long experience and with a yearly output of thousands could produce this car at so low a price. Only thus can quality of materials and of manufacturing be combined with economy of production. Because Chalmers does this is the reason why this Chalmers 7-passenger Touring Car has no competition at anywhere near its price of $1,350.

These Prove Quality Claims

Chalmers claims a motor of unexampled smoothness, of unusual power. Prove it by examining Chalmers Lynite pistons, 1/3 the weight of the usual cast iron. These give smoothness, less strain on bearings, admit of higher power. Compare the Chalmers crankshaft with others. It is one-piece, special steel, drop-forged, balanced in motion to a fraction of an ounce.

See the Chalmers Transmission

Gears are crucible nickel steel, case-hardened and heat-treated. They shift easily, without clashing, and properly used are practically indestructible. The Chalmers type of dry-plate, disc clutch is far in advance of other designs. Chalmers rear axle is the same as used in expensive foreign and American cars. It is silent, efficient, economical.

A Big Beautiful Body

Big—122 inch wheelbase. Beautiful—because graceful in form, hand-finished in Chalmers shops, upholstered in genuine pebble-grain leather, with new Scotch "fluted" finish. Auxiliary folding seats, Pantasote top, curtains open with the doors, fasteners are the "lift the dot" pattern.

Compare Quality—and Price

Think how great the difference between this quality Chalmers and other cars. Realize what unusual value is here offered. You will go much higher in price before you will find any other to please you so well. And all these claims we submit for *your* decision. Come—try the car. Investigate. Then only can you decide.

CHALMERS MOTOR CO. Detroit, Mich. U.S.A.

Concrete Drain Tile, ready to be placed in ditch

Tile Drainage Pays Big Returns

THAT wet land reclaimed by tile drainage will add so many more profitable acres to your farm. Drainage will increase crop yields of low lands. Drained lands can be plowed earlier in the spring. Tile drainage does away with expensive wasteful open ditches.

Use Concrete Tile

They cost no more to lay than other kinds—cost less in the end, because they are permanent. The strength of well-made concrete tile increases with age. Many of the largest drainage and irrigation projects use concrete exclusively.

Concrete tile are free from warp or other irregularities, true on the ends, smooth inside, easy to lay, and are certain to result in perfect line and grade. These are some of their many advantages.

A well planned and laid system of concrete tile drainage is a real investment, because concrete tile are permanent. A postal card will bring a free booklet about drainage and concrete tile. Say "Send me your Concrete Tile Book."

The Tractor and Its Prospects

PROBABLY no agricultural machine developed since the early days of the self-binder has been the subject of as much study and inquiry on the part of the farmer as the farm tractor," writes H. R. Brate in Farm Implement News. "From an annual sale of a little over 1000 five years ago the tractor trade has grown to a business of great proportion and possibilities, so that the sales last year, 1915, reached 22,500 machines, while this year it will go beyond the 50,000 mark. A few years ago the tractor, which then weighed from eight to 12 tons, was adapted only for breaking the tough, virgin sods of our Northwestern states, as well as those of the great Canadian Northwest, while the tractor of today is adapted to our smaller farms, and has correspondingly decreased in weight.

"One of the very important reasons why the tractor has found such a ready sale, and why it is going to be necessary for our farmers to employ more mechanical help than they have been doing, is the fact that more of our unimproved land must be brought into a state of cultivation as the average increase of improved land per farm during the ten years, 1900 to 1910, was only three acres, which is not enough to keep pace with our steadily increasing population nor to pay the farmer a fair return upon his investment; for farm values have more than doubled during the past ten years; the average value per farm being nearly $7,000.

"The last census shows us that to every 100 food consumers there are only six food producers, so it is apparent that farming has not been overdone, neither as to product nor intensity of cultivation. To be sure, there are years when we have locally an overproduction of some certain crops, but when we take the averages for the entire country we find that it has been largely a matter of faulty marketing and distribution. To show at what rate the number of food consumers is increasing, we find that our urban population, that is, the inhabitants of incorporated places of 2500 or over, increased during the last census period at the rate of over a million a year, 34.8 per cent, during the ten years, 1900 and 1910, while during the same period the rural population, which the last census placed at 49,000,000, increased only 11.2 per cent. Of this total rural population only one-eighth, or about 6,000,000, are farmers. Furthermore, the farmers of this country must furnish food for a greater part of Europe, which with devastated fields, would find it impossible to feed herself, even should the war stop this very moment. She will be dependent upon America for foodstuffs, for cattle and horses, and for tools for several years to come. The American farmer has had a great responsibility forced upon him in furnishing food to so many hungry mouths, and the only way he can meet it is to increase his acreage of improved land and the yield per acre.

Sugar Beets Require Deep Plowing

By Prof. G. E. Bensel in Sugar

PREPARATION of the land to be cropped to sugar beets is a very important operation, and many past failures can be attributed to the lack of sufficient attention given to the plowing.

If a sugar beet raised from high-pedigreed ancestors, well-shaped parents with a pivoting root, will encounter a compact soil lacking porosity, viz.: difficult to penetrate, it is easy to understand that the shape of the young plantlet will differ from its inherited tendency, and that its development, its form, its richness, will be strongly modified.

The object of the thorough preparation of the soil is to furnish to the sugar beet a medium in which it can freely develop all the qualities transmitted by its ancestors.

Deep plowing is the first principle of successful beet culture, because the root is thereby enabled to penetrate the sub-soil with no obstruction, thus preventing its growth out of the ground, and also allowing it to extract considerable nourishment from the soil.

Deep plowing means a deeper and better feeding surface for the beet. By plowing deep we pulverize a greater quantity of soil, bringing to the surface a large portion of dormant plant food, which, by the action of atmospheric agents such as air, moisture and light, will soon become available and consequently increase the fertility of the soil.

Furthermore deep plowing will considerably increase the water storage capacity of the soil, which is a very important work, especially in the semiarid regions where the average rainfall does not exceed 16 inches, and where the precipitation only occurs during the winter season.

By plowing deep the water will percolate better and more moisture will be stored. By deep plowing is meant 14 to 18 inches depth which should be reached gradually by increasing the depth two to four inches every year until the desired depth is obtained.

If the land has been plowed only eight inches deep, the next season it should be plowed ten to 12 inches, and so on. Unbroken land (or grain land), which has been plowed only very shallow should be plowed about eight inches the first year in order to avoid bringing up to the surface a too large amount of dead soil. New and unbroken land can be plowed 16 to 20 inches deep for the first time, if the land is to remain fallow for one year. During this time the air will bring life to the virgin soil by transforming the insoluble plant food into a soluble form, which will also stimulate the bacterial activity and leave the ground in an excellent condition for the sugar beet crop.

Deep cultivation not only increases the fertility of the soil but opens the land to the atmosphere; it facilitates the penetration of the oxygen, the absorption of the air moisture and helps the decomposition and assimilation of nutritious elements.

Besides all the above mentioned advantages, it has a destructive action on the larvae of injurious insects. Furthermore the spores of the leaf-spot will be killed if plowed under at a depth of 12 inches. Deep plowing is the most practical remedy against the leaf-spot; therefore all fields that were affected by this fungous disease should be plowed as deep as possible.

If the land was farmed to sugar beets the previous year, and by plowing out the beets the ground was left in a very rough condition (as often occurs in heavy soil), it is very advisable to have the land rolled and disked before plowing in order to prevent the turning under of big clods which will create open spaces in the subsoil which are so detrimental to the sugar beet.

All the land to be farmed to beets should be plowed as early as possible—this does not mean that the land should be planted early, as the date of planting depends greatly on the nature of the soil, its chemical composition, etc. Four to six weeks should elapse, at least, between the plowing and planting, especially if a new soil is brought to the surface by deeper plowing.

With the daily increasing use of the mechanical tractor in the sugar beet fields, the growers have intensified their method of farming by plowing their lands deeper and quicker, which means a greater storage of rain, a larger feeding surface for the root system, a better supply of plant food and more efficient action of the atmospheric agents, all conditions which will considerably increase the growers' profits.

SUGAR BEET SEED, 1916

Preliminary returns indicate that the area used for growing sugar beets for seed in the United States in 1916 was 5268 acres, and that the production of seed was 5,211,000 pounds, an average yield per acre of slightly less than 1000 pounds. The three states o

Colorado, Idaho and Utah contained nearly 5000 acres and produced approximately 5,000,000 pounds of seed. The above estimates are subject to revision.

Area and production of sugar-beet seed in the United States, 1916:

States.	Beets grown for seed. (Preliminary.) Area. Acres.	Production. Pounds.
California, Idaho and Utah	2,178	1,628,000
Colorado, Kansas, Montana and Nebraska	2,725	3,455,000
Michigan and Ohio	365	128,000
Total	5,268	5,211,000

The annual imports of sugar beet seed for the five years ending June 30, 1916, averaged 12,275,330 pounds, valued at $1,075,207. The imports increased from 11,389,394 pounds in 1912 to 15,882,661 in 1915, but decreased to 9,052,490 in 1916. The average import price per pound was 9.7 cents in 1912, 7.2 in 1913, 7.8 in 1914, 8.9 in 1915, and 11.5 in 1916. For the four years, 1912-1915, Germany supplied nearly 80 per cent of the sugar beet seed imported, or slightly more than 10,000,000 pounds annually; but for 1916 Russia was the source of about two-thirds of the imports, or 5,382,000 pounds.—Sugar.

WASCO FARM CENTER

We have the following news letter from the Wasco farm center:

"This is the largest in Kern County and still growing. In less than a year this center has increased its membership over 100, giving it at present 131 paid up members. Besides being the largest in the county we belive it to be the only one in the state that has a brass band of its own. The band has 20 members, all of whom live in or near Wasco.

"Our purchasing committee is another important factor, ordering various supplies in car load lots, thus making a big saving to its members. On five tons of alfalfa seed alone they saved over $700, and another $200 on a car of spuds. The monthly auction sales held here by the farm bureau are bringing very satisfactory prices for the farmer. It sure looks as though the only one not benefited by the farm center is the middleman.

"The Wasco center is planning a picnic in May and the band intends giving a concert in the near future.

"Owing to the interesting talks given by our farm adviser, George Kreutzer, the regular monthly meetings have an average attendance of at least 250."

MOTOR TRUCK SHOW

What is expected to be the largest motor truck show ever held west of Chicago is the Commercial Motor show, which is scheduled to occupy the Exposition Auditorium in San Francisco from April 3 to 7 and which will take up every inch of the more than 51,000 square feet of floor space available there. In addition to trucks there will be exhibits of attachments and accessories.

FAIRS AND EXPOSITIONS

Butte County Fair and Spring Exposition, E. J. Falk, secretary Chico, May 21-26.

Alameda County, W. J. Dakin, secretary, Pleasanton, July 4-7.

Monterey County, John J. Kelly, secretary, Salinas, July 11-14.

Hollister Fair, Hollister, July 18-21.

Petaluma Fair, Petaluma, July 25-28.

Mumboldt County, R. H. Smith, secretary, Ferndale, August 1-4.

Ukiah Fair, Ukiah, August 8-11.

Sonoma and Marin District Fair, Donovan Bros., Santa Rosa, August 15-18.

Solano County, A. C. Madden, secretary, Dixon, August 22-25.

Yolo County, Woodland, August 29-September 1.

Yuba County, Marysville, September 4-7.

California State, Chas. W. Paine, secretary, Sacramento, September 8-15.

Riverside County, C. H. Lewis, president, Riverside, September 17-22.

Ventura County, L. P. Hathaway, secretary, Ventura, September 24-29.

Glenn County, E. A. Kirk, secretary, Orland, September 26-29.

Fresno County, C. G. Eberhart, secretary, Fresno, October 1-6.

Kern County, T. F. Burke, secretary, Bakersfield, Oct. 1-6.

Kings County, E. Gravatt, secretary, Hanford, October 8-12.

Orange County, Dr. H. J. Stevens, secretary, Santa Ana.

San Joaquin County, John P. Irish, Jr., secretary, Stockton.

University Farm Picnic, Davis, April 28.

NEW TREES AND PLANTS FOR AMERICA

A wide variety of promising foreign plants is now being propagated and tested by the government in the plant introduction gardens maintained by the United States department of agriculture in Florida, California, Washington, and Maryland.

These gardens may be called the "Ellis Islands" of the plant immigration service. In them plant immigrants are carefully studied in order to make sure that they carry with them no disease and only those which are known to be desirable additions are permitted to make a home in this country. The plants which have successfully passed this scrutiny are distributed to the state experiment stations and to thousands of experimenters and breeders throughout the country.

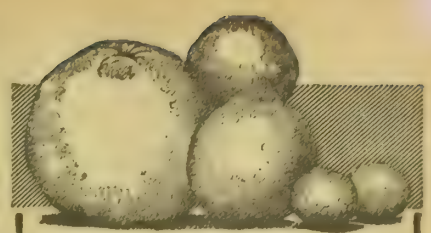
MARKET DIRECTOR'S REPORT

The first annual report of the state market director of California has been issued by Director Weinstock and contains much of interest as to investigations of marketing conditions in this state. From the report it is seen that the conditions are not satisfactory to the producer. We hope another report will show wherein the state has greatly improved these conditions.

FEEDING DEMONSTRATIONS AT FARM PICNIC

At the university farm picnic at Davis on Saturday, April 28, there will be demonstrations of experiments now being made to prove whether the most economical and efficient way to feed milo to swine is to feed it with the heads, to thresh it, or to feed it threshed and soaked in water. Pens of hogs are being fed in these three different ways. To find the value of rice as a stock feed is another experiment to be demonstrated.

The California State Fish, Game and Forest Protective League is the name of an organization which is pushing for senate bill No. 708, which abolishes the fish and game commission and transfers the duties and powers of that body to one commissioner and provides that neither such commissioner nor his deputies or assistants shall be members of any gun club. Matter issued by this league sets up the claim that every member of the present state fish and game commission is a member of a gun club and that the laws of the state are enforced so as to discriminate against hunters who are not members of clubs. The statement is made that the sum of $1,948,000 was spent by the fish and game commission during the past four years. If this is true it means that $250,000 a year is being spent by this commission, and this amount is vastly more than is spent by the state horticultural commission, which protects the greatest producing interests of the state.



PROFIT comes from fruit, not foliage. On Citrus fruits use immediately available

Nitrate of Soda

It works while the fruit buds are forming.

"Orange Culture" is a valuable book I will send to you Free if you will but ask for it. Send post card.

DR. W. S. MYERS

25 Madison Avenue, New York City

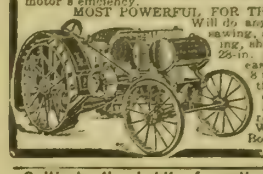
GALLOWAY TRACTORS

Square pulling, easily started, four wheels 12 h.p. at draw bar, with surplus of 4 h.p. by actual dynamometer test. 20 horse power on belt. Four cylinder, water cooled, long stroke, modern motor. Transmission a unit with motor. By actual test requires only 13.3 per cent of motor's power to propel itself, delivers at the draw bar 86.7 per cent of the motor's efficiency.

MOST POWERFUL FOR THEIR WEIGHT

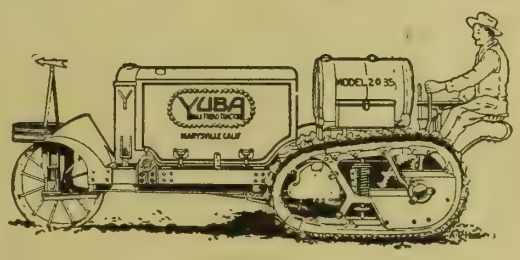
Will do any portable engine job, sawing, silo filling, corn shredding, shredding; easily handles 28-in. grain separator; pulls easily three 14-in. bottoms 6 to 9 in. deep in clover or timothy sod. Unexcelled for road building. My new 1917 catalog is ready. Ask for it today.

WM. GALLOWAY CO.
WATERLOO, IOWA



Cultivate the habit of reading advertisements and get the news of the manufacturing world

What will it do for me?



Yuba 20-35

It will plow 15 to 20 acres per shift.

It will disc 35 to 40 acres.

It will haul 20 tons on high speed on a reasonably good road.

It will operate a 32-inch separator.

It will pull an independently operated combined harvester with a 20-ft. cut.

It is powerful enough for any job—small enough to go almost anywhere—simple enough for any one to drive.

It is the ideal machine for the wheat farmer, the rice grower, the bean raiser and the contractor.

BUY A YUBA

Which size is best suited for your needs?

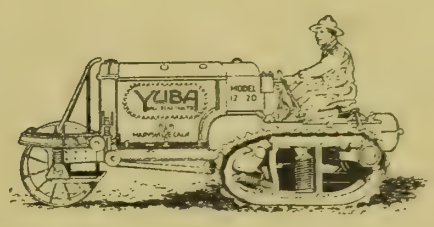
Yuba Manufacturing Company

(*Formerly The Yuba Construction Company—change in name only*)

433 California Street
San Francisco

Factories at Marysville and Benicia, California

What will it do for me?



Yuba 12-20

It plows 10 acres, cultivates 25 acres, and hauls 12 tons per shift.

It will operate a 6-inch pump.

It is narrow enough to go in 7-ft. hop rows, or 7-ft. vineyards.

It is the right design for beet growers who plant in 20-inch rows.

It is the only tractor for the asparagus grower.

The Model 12-20 and the Yuba plow form a one-man outfit—even in the orchard.

An all around machine—though it was designed especially for the orchard.

BUY A YUBA

Yuba Manufacturing Company Dept. B8

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The importance of the nursery business in California is shown in the leading article of this issue and in the illustration on the cover page. Hundreds of thousands of deciduous nursery trees and vines were in the yards of the Fancher Creek Nurseries at Fresno at the time this photograph was taken. Most fortunately for the welfare of California a photograph taken today would appear vastly different for these yards are now practically empty, and many hundreds of acres have been planted to orchards which will prove profit bringers to California.

In output of nursery trees California now leads the world; New York and Texas rank second and third.

PURCHASING COOPERATIVELY

The farm adviser of Kern County states that one farm bureau in that county has saved over $900 to members through buying seeds, posts, cement, potatoes and other commodities in car lots. Purchasing committees in other centers are likewise saving large amounts to members. Every day sees advancement in cooperation.

J. A. DRIFFIL

Major J. A. Driffil, manager of the American Beet Sugar Company's plant at Oxnard, died during the past week. Major Driffil was one of California's pioneers, locating in Pomona more than 30 years ago. He was at one time manager of the Chino sugar factory and since the construction of the great plant at Oxnard in 1898 has been its manager. This plant is the second largest in the United States and has been one of the most successfully managed.

"TEMPUS FUGITS"

The "American Motorist", in calling attention to the fact that the world does move and improve, says that today one could hardly believe it was only a score of years ago, or in 1896, when it was necessary that all motor cars on the highways of Great Britain should be preceded by a man on foot waving a red flag.

When one reads of the accidents caused by speed maniacs it seems as if a return to the old time methods might be necessary even yet. However, the world is moving more swiftly.

IN OPERATION

In another column announcement is made of the officers and directors of the new federal farm loan bank at Berkeley. Dr. Elwood Mead of this state is one of the directors. We doubt not this institution will be ready within a very few weeks to advance funds.

Almost daily there is inquiry of the Cultivator as to steps necessary to secure these loans. This information has been given in our columns, but in a word the first step is to organize a local association and write at once to either Dr. Mead at Berkeley or the secretary of the farm loan board at Washington for blanks and information. Every community which would borrow must have an association of at least ten members who shall borrow $20,000 or more.

DIM THE HEADLIGHTS

Careful autists are hoping for more rigid enforcement of the law as to dimming glaring headlights. The law enacted in 1915 has never been enforced as it should be. An excellent suggestion is made by the American Automobile Association, with the following recommended legislation:

"Glaring Headlights: It shall be unlawful to use on a vehicle of any kind operated on the public highways of this state any lighting device of over four candlepower equipped with a reflector, unless the same shall be so designed, deflected, or arranged that no portion of the beam of reflected light, when measured 75 feet or more ahead of the lamps, shall rise above 42 inches from the level surface on which the vehicle stands under all conditions of load. Spot lights shall not be used except when projecting their rays directly on the ground and a distance not exceeding 30 feet in front of the vehicle.

PREPAREDNESS

If there was ever a time when preparedness in agricultural practice was of value it is at the present moment. Not in many years has the natural food supply been so low. Reports from the department of agriculture show that in storage and in warehouses of all the states potatoes, refrigerated meats, wheat—everything eatable—show a shortage of from ten to 50 per cent.

There have been some doleful predictions as to America starving unless an embargo is laid on foodstuffs, but with the new harvests as close as they are and as abundant as they give promise of being, we believe there is no danger of hunger. The problem is not so much an embargo on exports as an embargo on the methods of food speculators.

The situation calls for serious thoughtfulness and affords an opportunity for the farmers. If given a good season we believe this year's business will be the best this country has ever had. There will be better cultural methods followed; so far as possible there will be more use of fertilizers; more effective marketing organizations will aid producers in securing just returns. It has been charged that the farmers have organized to unduly boost prices. This is not true. The farmers have organized and demanded just returns for their labor, which have not heretofore been given them. Yet there was no call for aid from women's clubs or other organizations, but the moment speculators boosted prices beyond reason the clubs took hold of the situation and demanded justice. As one paper has suggested, these organizers of boycotts should look at the farmer's side of the question as well as their own. However, the movement may result in calling attention to abuses of the middleman, and there may be less loss between producer and consumer.

In any case produce more and produce better and be prepared for any condition which may come. We are now importing potatoes and onions from Japan. Home grown ones will taste better.

TO MEMBERS OF COW TESTING ASSOCIATIONS

COW testing associations are increasing; their work is invaluable and dairymen are richer because of it. In the state dairy cow competition the Cultivator is endeavoring to advance the work of these associations by offering prizes for highest testing herds. At first the announcement was made that these tests should be under the direction of a man from the state university who should make regular monthly inspection and tests. This made the cost to each competitor too great, as the competition covers a period of 12 months, and so a change was made, and Prof. Woll, who has this competition in charge, ruled that "the terms for the award of the three prizes of $100 each (offered by the California Cultivator) for the highest average production of butterfat for one year by herds owned by members of a cow testing association, have been modified so as to leave the certification of the yearly reports in the hands of the officers of the association. No monthly test checks will be conducted by the college of agriculture in herds competing for these prizes, as will be the case for cows in cow testing associations competing for other prizes, for records by individual cows or by groups of cows in the same herd."

This ruling was not understood by many dairymen who now express a desire to enter the competition. To encourage the industry and these dairymen the time for entry has been extended to May 1. This can only be taken advantage of by those who have been members of associations and whose records have been kept by the regular cow tester of the association, for while entry may be made as late as May 1, the records upon which the competition will be based may begin any time between November 1, 1916, and March 1, 1917.

There are now entries in all of the three classes, that is, dairies of ten to 25 cows, of 26 to 50 cows, of over 50 cows. Remember the winner in each one of these classes, at the completion of the contest, March 1, 1918, will receive the Cultivator's check for $100.

Write at once to Prof. F. W. Woll, University Farm, Davis, for entry blanks and information.

Agricultural Notes

The National Swine Show will be held at Omaha, October 3-10.

There are now only about 30 co operative bull associations in the United States.

The number of ships which passed through the Panama Canal in 1916 was 1253, or 83 more than the number making the transit in 1915.

Shipments of frozen eggs to the United States in 1916 from Nanking, China, amounted to 6,000,000 pounds nearly tripling the shipments in 1915.

British Columbia potatoes were sold for the first time in New York, Missouri, Kansas, Minnesota, California, Washington, and other states during 1916.

The extermination of ground squirrels from approximately 209,000 acres of government land was accomplished last year by the United States biological survey.

Brazil is encouraging extending the cotton industry. So far no use has been made of the oil or hulls, and special effort is being made to develop manufacture of these by-products.

Potatoes may now be imported into the United States from the following countries under permit: Denmark, Holland, Belgium, Cuba, Bermuda, the Dominion of Canada, and Victoria, Australia.

The New Zealand government has several experimental farms. One near Hamilton, about 86 miles south of Auckland, is the most important and contains 914 acres, most of it being under cultivation and grazing.

Government crop report.—Estimated stocks of barley on farms in California March 1 this year 3,000,000 bushels, compared with 5,127,000 a year ago and 5,468,000 two years ago. Price March 1 to producers, 113 cents per bushel, compared with 71 cents a year ago and 76 cents two years ago.

A. R. Gould sends the Cultivator a letter received by him from the director of agriculture of the Gold Coast Colony of West Africa, stating that "the production of cocoa for the year 1915 was 80,000 tons, or one-third of the world's production. He says that last year (1916) would be even more. This is the result of agricultural education amongst the natives."

Greatly increased production of potash in this country during 1916 is reported. The total production of potash salts and potash products in the United States in 1916 represented about 10,000 tons of potash with a net value at point of shipment of at least $3,500,000, figured at the prevailing selling prices. This is ten times the value of the 1915 production.

Bills limiting the length of freight trains have been introduced in the state legislatures of Missouri, Iowa, Kansas, Colorado, Utah, Nebraska, Texas, New York and Oregon. The bill introduced in the Missouri legislature limits the length of local trains to 30 cars and through freight trains to 45 cars. The provisions of the bills introduced in the other states differ as to details but are all alike in principle and purpose.

Chinese peanuts are said to average 46 per cent oil. The oil is extracted and exported in large quantities for use in cooking, as a substitute for olive oil, and largely in the manufacture of soap. The value of peanut oil exported in 1915 exceeded by more than 50 per cent the value of all peanuts shipped. After the extraction of the oil the product remaining is formed into cakes which are used as fodder, poultry feed, or fertilizer.

Agricultural News Notes of the Pacific Coast

Northern California

Pear growers are getting ready for the fight against thrips.

The planting of sugar beets has begun at Meridian, Sutter County.

Some experiments will be made with cotton growing in Colusa County this year.

Many farmers of Butte County are convinced that they should have a farm adviser.

Cottonseed meal is being fed by sheep men of Klamath (Oregon) and Lake Counties.

Twenty-four carloads of rice left Colusa last week, most of it going to New England markets.

Sutter County peach growers have hopes of securing as high as $42.50 a ton for this year's crop.

Butte City and Biggs report brisk sales of rice at $1.91. One firm reports the sale of 13,000 bags.

The pig club of the Chico high school has begun its feeding contest. A $70 registered pig will be a first prize.

Farmers of Glenn County are talking of the necessity for securing a squirrel destruction ordinance in that county.

Some peach orchardists of Bogue, Sutter County, report signing contracts for their crops for ten years at $30 per ton.

Cooperative purchase of 75 tons of commercial fertilizer has been made by members of the Eldorado Potato Growers' Association.

The Eldorado County Standardized Fruit Alliance has declared its opposition to the fruit standard bill now before the legislature.

A Grass Valley rancher has been trapping wild animals, securing bounty for their pelts and cooking the carcasses for poultry feed.

Northern California is discussing the advisability of celebrating rice week in connection with the Butte County Spring Exposition.

Dr. J. W. Hendry of the state university advises the planting on bean lands of winter crops, such as horse beans, field peas, garbanzos and lentils.

Plumas County supervisors have gone on record as favoring a law to make all non-navigable streams public highways for the purpose of public fishing.

The Oroville Register reports arrest of a Biggs rice grower who shot wild ducks that were eating his rice. The rice was headed out low and being used for hog pasture.

Influenced by the wonderful showing made by university steers at the recent Chicago international the state board of control has recommended that the legislature give a substantial appropriation to aid the animal husbandry division of the university in carrying on further experiments in raising beef cattle and sheep.

A meeting of the California Jersey Breeders' Association was held in Loleta recently. The main object of the meeting was to give official support to the state dairy cow competition. The following were made members of the association: S. J. Damon, John Trigg, Jr., Bernard Crowley, of Ferndale; W. H. Perrott of Loleta and C. W. Ward of Eureka.

Central California

Tulare County has voted $2,200,000 roads bonds.

Great preparations are being made for Raisin Day, March 30.

Heavy blossoming of apricot trees is reported in Tulare County.

Vineyard workers of Fresno have established an employment bureau at Fresno.

Three thousand acres are now being planted to alfalfa at Oakdale, Stanislaus County.

Owners of land in Kings River bottoms are planting an unusually heavy acreage of potatoes.

Fruit canners are reported to be making peach contracts in Santa Clara County at $40 a ton.

Fresno County supervisors have appropriated $2000 for the maintenance of a farm adviser's office during the next year.

The Pacific Pea Packing Company at Oakdale, Stanislaus County, will this year can hominy, beans, and pork and beans.

The Lindsay Ripe Olive Company is considering adding equipment which will enable it to handle tomato canning this summer.

Three new sugar factories are announced for San Joaquin County at Tracy, Manteca and Stockton. All are to be $2,000,000 plants.

There are 25,000 dairy cows enrolled in cow testing associations in this state. Four thousand of them are in the one county of Imperial.

A new packing house has been announced for Lindsay. It controls about 1000 acres, equally divided between navels and Valencias.

The chamber of commerce of Coallinga has requested the Tulare County supervisors to assist in having made a soil survey in their district.

At the sale of fat hogs at Wasco March 10 members of the Kern County farm bureau secured an average of $19.70 per head on the five carloads sold.

The Miller & Lux corporation has signed an agreement with the Madera irrigation bureau to join in the formation of an irrigation district in Madera County.

Poland-China breeders formed a state association at Hanford last week with W. Bernstein of Hanford as president and R. H. Whitten of Los Angeles, secretary-treasurer.

The great Woodward reservoir, east of Stockton, will be dedicated in May. This reservoir will store 35,000 acre feet of water for summer irrigation of the South San Joaquin district.

The Poplar district of Tulare County raised its first crop of beans in 1916, amounting in value to $32,000. Dealers are now reported offering contracts at seven cents for next year's crop.

Supervisors of Merced County have passed a weed eradication ordinance and have also authorized the purchase of one and a half miles of wire fence for construction of a portable rabbit corral to use in rabbit drives.

The biological survey has sent a squirrel extermination expert to Fresno County to aid the farmers in their ground squirrel campaign which has been started under direction of Neil Anderson, county ground squirrel inspector.

Southern California

Fishing is reported good at Lake Elsinore.

Cotton planting is beginning in Imperial.

Beet planting is practically finished in Orange County.

The packing house of the El Cajon Growers' Association employs about 30 people.

Apricot growers of Perris report no injury to apricot blooms from the recent frosts.

Kansas City packers are seeking for feeders amongst Southern California swine raisers.

Riverside sent out 5000 sample boxes of oranges as part of its Orange Day celebration.

Citrus growers met in Pomona last Friday and discussed improved frost fighting methods.

Contracts for 1917 limas are reported being made by the Lima Bean Association at eight cents.

A state dairy inspector has been going over dairies in the section about Oceanside, San Diego County.

Chino is discouraged over the prospects of securing a cannery of the San Antonio Growers' Association.

Cotton growers of Imperial Valley are planning to put in at least 115,000 acres of long and short staple.

Trustees of Redlands are discussing advisability of hiring a gunman to dispose of the pest of sparrows.

Governor Cantu of Lower California has issued a quarantine against all unmanufactured cotton products .

According to report of Commissioner Beers of Santa Barbara County the mustard crop amounted to 2000 bags.

Ventura County reports "bean picking" or the sorting of the mature beans in warehouses as practically ended.

The new olive plant at Fallbrook has shipped out its first carload of olive pickles, the shipment going to New York.

Bean growers of San Luis Obispo County are sending requests for large shipments of lady birds to control bean aphis.

Supervisors of San Diego County have voted $1000 to be used in cooperating with the forest service in protection from fire.

The management of the National Orange Show at San Bernardino reports attendance of 25,000 on Saturday afternoon, February 24.

Japanese growers of chili peppers at Garden Grove have demanded a five dollar increase in price as condition of planting this year.

For the benefit of growers of Egyptian cotton the quarantine has been lifted against importation of seed from Maricopa County, Arizona.

At the last meeting of the Beaumont Fruit Growers' Association a marketing committee was appointed to decide on plans for the coming season.

The Poultry Producers of Southern California, the newly organized poultrymen's association, has notified subscribers that its stock books will be closed April 1.

The rains prevented shipment of some citrus fruits to fill the market for Orange Day. This is regrettable and has resulted in some dealers holding for stiff prices.

The Coast

Sugar beet growers of Grants Pass, Oregon, have formed an association.

The agricultural extension service of the University of Arizona is starting a boys' cotton contest.

A committee of wool dealers is conferring with the United States quartermaster department in regard to filling army contracts.

Two mountain lions were killed by a Mexican on the Dumbell ranch of J. W. Stewart near Simmons, Arizona. The lions measured nine feet from tip to tip.

The American Shorthorn Breeders' Association is making known the merits of its breed by exhibiting picture films made at the Chicago International last fall.

The campaign of the board of agriculture of Hawaii to eradicate tuberso successful that it is now stated that 90 per cent of the herds are entirely free from infection.

Stock feeders in the district about Meridian, Idaho, have organized the Boise Valley Grazing Association, which will cooperate in hiring men to take care of cattle on government range.

A "wool car" from Washington, D. C., has been secured by W. S. Thornber, director of the extension department of Washington State College, to tour Washington the latter part of March.

The Caldwell (Idaho) Horse and Mule Market announces that a sale will be held every month. At a recent sale prices were good, some of the animals bringing as high as $270, with an occasional team running as high as $475.

Arizona cattlemen attended the eleventh annual session of their state organization at Globe March first, second and third, many of them going from there to El Paso to attend the annual of the Southwestern Stockmen's Association March 6, 7 and 8.

A class of 100 farmers scattered throughout the farming sections of Yamhill County, Oregon, have been enlisted in a farm management project. The work consists of taking an inventory of all live stock, feed, machinery and tools on hand March 1.

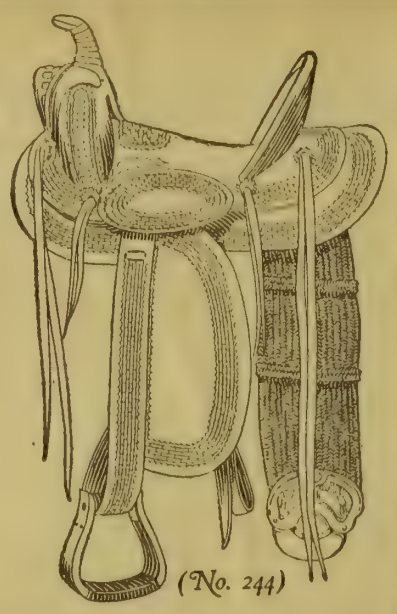
The number of dairy cows in Arizona increased 40 per cent during 1916 according to the figures recently made public by the United States department of agriculture. Montana increased 15 per cent, New Mexico 12 per cent and Wyoming ten per cent.

Forest Inspector Hense of Arizona is recommending that a large area infested with loco weed on the north side of the Chiricahua Mountains be fenced to keep cattle off, as it has already caused the death of hundreds. The loco weed is the only green thing on a tract of 20,000 acres.

The Whatcom County (Washington) Dairymen's Association has been considering the problem of pooling their product with a view to economizing in market methods and receiving greater consideration at the hands of the buyers. A similar plan is being worked out in Snohomish County.

A bill is before the Arizona State Senate, making it possible to borrow money from the state on unimproved lands for the purpose of improving the lands. No loan is to be made on land worth less than ten dollars per acre, and the amount of the loan shall not exceed one half the value of the land, and may not be more than $5000.

HERCULES SADDLE



MODERN bulge-front; hide-covered tree; steel horn.

A saddle for every day use, looks all right, and wears all right.

The price is only $40.

(No. 244)

When a dealer offers you a *Hercules* Harness, Horse Collar or Saddle, he is offering you *THE BEST THERE IS.*

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY
YOUR COWS MADE PROMPT, REGULAR BREEDERS BY
STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK.** It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. Price $1.00. Mailed postpaid, in plain wrapper.

Butter and Cheese Scoring

By H. S. Baird

THIRTY cubes of butter and cheese were entered in the first scoring of the 1917 educational scoring contest. A few buttermakers were present and went over the butter with the judges after it had been scored. We hope that this feature of the contest will grow and that we may have more present at future scorings. We are holding the scorings in different parts of the state in order to afford butter and cheese makers this opportunity and it is hoped that they will take advantage of it.

P. Peterson of the Valley Flower Cooperative Creamery of Ferndale received the highest score on butter with 94¼. The high scores on cheese were as follows: Cheddar, Arthur Schoenrock, White & Terry Cheese Factory, Galt, 94; California (Granular), Silvia Guidici of Santa Cruz, 94; Jack, Rufus Steele of Swanton, 93.

The scoring was done by T. J. Harris, official inspector of the San Francisco Wholesale Dairy Produce Exchange, H. S. Baird and S. L. Denning of the dairy division.

Butter of Good Quality

S. L. Denning, who was one of the judges, makes the following comment on the butter: "The butter in this scoring was the best that has been received for some time, the average score being 92.38. This is higher than the average for any one contest of 1915 or 1916. Of the 30 cubes, 12, or 40 per cent, scored extras or better, and 26, or 86.6 per cent, scored 92 or better. There was only one score below 90. It is encouraging to have so large a percentage of the entries scoring well up into the grade of extras. The most common criticism on flavor was that of feed. This is a very common defect at this time of the year due to the green feed. Aerating the cream during pasteurization will help a great deal to eliminate the feed flavors. Some samples were criticised for an unclean flavor. In practically every case of unclean flavor the buttermaker reported the use of cream which was two to nine days old. Too much emphasis cannot be laid upon the value of cream grading; one can of poor cream can throw off a whole churning.

"A large number of the samples were very high in salt. It seems to be the practice of the buttermaker to try to obtain more overrun by increasing the salt content of the butter. When the salt content gets too high the fine, delicate flavors are covered up and lost. Several of the cubes would have received a higher score had the salt content been lower. The body of the butter showed a wide variation. A few of the entries from the northern part of the state where large amount of dry feed is still being fed, showed a typical winter body. On the other hand, a large number of the entries had a very weak, leaky body. This leakiness is probably caused by the buttermakers not lowering their churning temperatures enough to suit the season, which results in the butter coming very soft. The working of this soft butter in the presence of excess water very often results in a weak, leaky body. By carefully regulating the churning temperature and the working a great deal of this leakiness can be avoided."

Few Cheese Entered

There were 16 entries of cheese, representing ten factories. (Some factories entered in more than one class.) The small number is due largely to the fact that many factories had not opened for the year. The dry winter has resulted in late pastures, which in turn has caused the large spring cheese make to be late. The average score of all cheese entered was 91.12. It will be noted that this average is 1.26 lower than the average score of the butter, which is probably a fair comparison of the qualities of these two dairy products of California. California is importing more than twice as much cheese as she is making, and if the quantity of cheese which is now being imported is to be supplied by home factories, it will be necessary to raise the quality of our cheese. The average scores of the different classes of cheese were as follows: Cheddar 92.2; California (Granular) 91.5; Jack 89.3. The main criticism on the California (Granular) and Jack cheese was the bitter flavor. This flavor can be overcome by better curing of the milk and the use of commercial starter. Several of the Cheddar cheese were criticised for being sour. This flavor may be caused by a poor starter or the retaining of too much whey in the curd. Several entries in this class were criticised for being too open in texture.

It is still possible for cheese makers who have not entered to secure a Grade A certificate. For buttermakers who did not enter the first scoring it is possible to secure a Grade B certificate if entries are sent in for the next five scorings. Those desiring further information may secure same by writing to the Dairy Division, University Farm, Davis.

Poland-China Association

Mr. Briggs gave to Cultivator readers in last week's issue information regarding the organization of the Poland-China breeders of California. These breeders are determined to make known the merits of their favorites, and to that end the secretary, R. H. Whitten, proposes plans of work. From his opening address at the organization meeting we quote:

"In putting the Poland-China to the front in this state and keeping him there, there is a great deal to be done, yet it can easily be accomplished if we work together. It's like the remark of the Irishman to his companion as they were traveling along on foot and came to a guide board which read '10 miles to Boston.' 'Come along, Mike,' he said. 'That's aisy. It's only five miles apiece.'

Really, there is a great deal of philosophy in that remark. Think of what the Holstein-Friesian Association has done for its breed. Irrespective of the merits of Holstein cattle, do you think it would be possible for bull calves to sell for $20,000 at public auction, and cows for $10,000, if it were not for the wide-spread publicity given to the breed by this organization? Impossible. For nowadays merit must be coupled with publicity to win attention. This association spends thousands and thousands of dollars in advertising, to keep before the public the good qualities of the breed, and thousands more in prizes to encourage record making. Furthermore, it is so wide-awake that it makes a booster of every member, which is pretty nearly the same as saying every breeder of registered Holsteins.

"These Wisconsin breeders certainly are boosters. Only yesterday I clipped one of their ads. 'Buy them in Wisconsin where Holsteins thrive. Four thousand pure-bred herds in the state. The Holstein-Friesian breed has made Wisconsin the leading dairy state in the Union. It is supreme in Wisconsin. Our free booklet proves this claim. Write for a copy.' That is the way we ought to be boosting the Poland-China in this state.

"We want a state organization of broad scope. We want a department to govern the public sales, passing upon the animals entered and seeing that no faking is allowed. And we want another committee to encourage live-stock exhibitions, to interest breeders in showing, to help them select their animals and condition them. We want to get behind the banker-farmer movement, working with the banker to get him to loan money to farmers for the purchase of registered Poland-Chinas, and with the farmer to get him to borrow in order to make the right start. We want to get behind the Pig Club movement. There are 10,000 members of Pig Clubs in the United States today, and the number is doubling every year. We want a publicity committee. Then we should have a service department that will give any member any kind of information, advice or assistance he needs."

Hanford Poland-China Sale

Written for California Cultivator By C. A. Briggs

A MOST satisfactory consignment sale of Poland-China swine of high quality was held at Hanford on March 7. Eighty-two head of hogs found new owners who parted with $3932.50 to secure them. Seventy-five mature animals brought an average of $51.17.

Thos. Carlyle of Sanger was the largest buyer with a total of 33 hogs for which he paid nearly $1300. G. H. Loughery, Visalia, paid $200 for the boar, Panama Silver, bred by F. D. Ross and $150 for John Bernstein's sow, Effie B. These were the top prices obtained. Two sows of W. D. Trewhitt breeding at $125 each were bought by the Tagus Ranch. Number 32 in the catalogue, "Pride of Kings", a December sow pig bred by W. F. Bernstein of King's Wonder, Candy Kid and President lines was offered to the bidding of women only. Spirited bidding between Mrs. R. F. Guerin, Mrs. W. D. Trewhitt and Mrs. T. J. Gilkerson, resulted in Mrs. Gilkerson getting the coveted scion of royal families at a price of $85.50, or exactly $1.65 a pound.

The sale opened promptly at 10 a. m. with Col. Ben Rhoades of Los Angeles as auctioneer, assisted in the ring by W. F. Bernstein and T. J. Gilkerson.

At the noon hour everyone ate roast pork of the registered Poland-China kind. This is the third sale of the Kings County Poland-China Breeders' Association and the third success, prices ruling higher than at previous sales.

The consignors were M. Bassett, W. F. Bernstein, J. A. Crawshaw, John M. Bernstein, T. J. Gilkerson, F. D. Ross, W. D. Trewhitt and Oscar and Clarence Dimmick.

The buyers were: Thos. Carlyle, W. T. Dice, L. M. Essick, H. D. Eberle, R. F. Guerin, A. T. Lewis, G. H. Loughery, O. L. Linn, H. I. Marsh, J. K. Macomber, W. F. Mitchell, F. Mathos, H. L. Stephens, Vossler Bros., Geo. T. Farmer, Frank Johnson, W. C. Ramos, W. Bernstein, C. F. Starr, F. D. Ross, Mrs. T. J. Gilkerson, J. A. Crawshaw, S. D. Crum, W. S. Hubbard.

Start Your Show Herd Now

Written for California Cultivator By F. R. Steel, President Western Berkshire Congress

The one great Berkshire show of the West in 1917 will be the Western Berkshire Congress Show held at Salem, Oregon, in conjunction with the 1917 Oregon State Fair. These congress shows are probably the strongest factors for the progress of the Berkshire breed in the West. Certainly they are the greatest institutions in the West for spreading a general knowledge of fine qualities of the great breed of swine. Just as certainly these swine shows are an education to both visitors and still more so to exhibitors. In order to be successful in the sale of his output every breeder of pure bred stock simply must bring the good qualities of his product before the buying public. There is no way in which this can be done in Berkshires as well as by exhibitors showing at these Congress shows.

You should begin picking out and fitting your show herd now. Select the one or two most promising March or April boar pigs of this year's farrow with three or four or perhaps five of the best sow pigs of the same age and push them along on full feed as best you can for the "Under Six Months" or "Junior Pig" classes. One boar and three sows of this age can be entered as an "Under Year Herd," and if four of them are by one sire they can enter again as "Get of Sire"; and if four are out of one sow they can also be entered as "Produce of Dam." These group and herd entries give an exhibitor a chance for more winnings at no greater transportation, feed or care expense—a more efficient show herd. Just the same thing can be done in the "Under Year" class, pigs farrowed after September 1, 1916. This same sort of line up can be well followed in the older classes, showing one boar, either an aged, senior yearling, or junior yearling; and three sows of one or more of these classes, and then bringing in the four as a senior or "Over Year" herd. If bred by the exhibitor all the herds may be again shown as "Herds Bred by Exhibitor."

It is better to show all sows one year old or over in pig if possible, as they show better in this condition; and any danger of the show condition causing future barrowness is thereby entirely avoided.

Field Notes from the Live Stock Men

Top Notch Durocs.—A corking good lot of registered Duroc-Jersey hogs recently came into California from some of the leading herds of the Middle West. In the lot is the line bred Golden Model sow Model Lady 501842 bred to King's Col., the great boar formerly owned jointly by H. H. Koenig and W. M. Putnam & Son, the latter finally buying Koenig's half interest in the boar for $1,000. King's Col. is considered by competent judges to be one of the greatest living big type Duroc boars. In the shipment also were six gilts that go to the Hawaiian Islands. Five of these gilts are by Shego, son of Illustrator, the $1,815 boar that was Grand Champion at Illinois state fair. The other is a Golden Model gilt that goes to the herd of Spalding & Co. in Glenn County. Then there is a Uneeda Crimson Wonder sow bred to E. A.'s Crimson Echo; several daughters of King's Col; some line bred Crimson Wonder's and Golden Model's; and a line bred Ohio Chief sow bred to a son of King's Col., Giant Col., a first prize boar at Nebraska state fair. In the same shipment there came out a registered Berkshire sow from the herd of Prof. C. F. Curtiss, Ames, Iowa. This good sow is bred to Rival's Champion's Best, and goes to A. Pelko, Glenn County. The entire shipment consisted of 30 head and was selected and brought out by Clayton Slocum, junior member of the firm of H. P. Slocum & Son, proprietors of Uneeda Duroc Herd of Willows.

Good Records at Millbrae.—Two more good A. R. O. records were recently hung up in Millbrae Herd of registered Holsteins, owned by The Mills Company Inc., Millbrae. Truly of Millbrae completed a 7 day official test with 27.53 pounds butter to her credit, and Kentra of Millbrae made 23.78 pounds butter in the same period. Neither of these were given any special preparation for test and Truly of Millbrae displayed such a fussy temperament about her food that she made a 27 pound record on a particularly scant diet. Both of these young cows are by Napoleon of Hopland, sire of Angelina of Millbrae, who made 31.86 pounds butter last season as a 4 year old.

Palo Alto Stock Farm is coming to the front with some mighty interesting records in both the registered Holstein and registered Guernsey herds. A very good lot of short time official records have recently been completed by the Holsteins. Heading the list is Jennie Terzool Hicks 4th, who made the nicely balanced record of 600 pounds milk and 32.7 pounds butter in 7 days. Four daughters of King Pontiac Butter Boy performed well in this group. Of the four Neva De Kol Posch 4th made 26.89 pounds butter, Lady Genevieve Ormsby made 26.80 pounds butter, Neva De Kol Posch Pontiac made 19.36 pounds butter, and the 2 year old Gold Leaf Pontiac made 17.98 pounds butter in 7 days. Other 7 day official butter records made in the herd include the 3

Breeding Stock For Sale

G. A. Murphy - - Perkins, Cal.

When writing advertisers, mention the Cultivator.

year old Lily Wayne Pauline, 21.90 pounds; the 3 year old Roxy Pel Netherland 4th, 24.3 pounds; Roxy Pauline Burke Hengerveld, 26.3 pounds; Buckeye Pietertje Maid, 23.7 pounds; the 3 year old Blue Belle Hengerveld Clothilde, 22.32 pounds; Mousie De Kol Lady 2nd, 24.48 pounds; Athalvia 2nd, 25.01 pounds; the 3 year old Pietertje Sadie Vale 2nd, 19.14 pounds; and the two 2 year olds Thelma Horlog Sunderland and Pearl Boone Colantha made 18.36 and 18.6 pounds respectively. There are some mighty promising members of this herd just fresh or about to freshen and there is reason to look for some big records soon. The great 32 pound cow Laurameka is just fresh and looks fit to increase her record. But the Holsteins can not claim all the production honors at this big breeding farm. There are four good registered Guernseys on yearly test, all making over two pounds of butter fat per day. The leader is Imp. Miss Jane of Lewiston, now in milk for three months, and the day the writer saw her she milked 72 pounds and she is testing right up around 4.75 per cent. Work is just fairly started in putting the Guernseys on yearly test, but before long there will be a nice string going. M. H. Tichenor, the resident partner, is whipping the big breeding farm and the certified milk producing plant into smooth working form and from now on this herd is bound to be heard from. In the handling of the test work he has an able assistant in Jim Andersen, who recently came out from one of the leading Minnesota establishments, and who had charge of the cattle during the time the recent tests were made.

Fred W. Kiesel, president of California Holstein-Friesian Association, is giving liberally of time and thought in mapping out a constructive program for the rejuvenated organization. One of the most useful activities of the association will probably develop out of the plan to hold a series of meetings at various points throughout the state. The first meeting scheduled will take place at Modesto on the evening of April 18, which is the evening preceding the H. E. Cornwell sale. The second meeting will take place at Napa on May 5, when the association will be the guests of Mr. Owen Duffy, business manager of Napa state hospital. Another meeting will be held at Chico during the week of the Butte County Spring Exposition, and another meeting will be held at University Farm, Davis, possibly on Decoration day during the big Farmers' Week, and the day before the big Holstein sale to be held under the management of California Breeders' Sales and Pedigree Company. These meetings should prove of great benefit to all Holstein breeders throughout the state, in bringing about a better acquaintance among them and providing a meeting place where the discussions are bound to be mutually helpful and interesting.

Registered Holstein Bulls were never in such great demand throughout California as they are today. The writer has recently covered California from Sacramento to San Diego twice, and not for two or three years has he seen so few bulls of service age on hand on the breeding farms. And this in spite of the fact that there is a considerable increase in the number of purebred herds. Not a single herd visited had any number of year old bulls on hand, and practically every one was selling calves down to six and even four months old. All of which means that the bull crop is rapidly moving into grade dairy herds, where its good blood will further stabilize and make more profitable the dairy industry of the state.

J. L. Gibson Co., Williams, has recently sold bulls to E. W. Stanton Jr., San Joaquin Valley Land Co.; and Roebel Co. Mr. Gibson now has 16 cows on yearly test. He has increased the farm's silo capacity to 450 tons.

The Melone Co. report the following sales of pure bred Chester-White hogs raised at the Oak Knoll Ranch, Napa: Niebaum Estate, boar; Henry Harris Estate, boar; Karl Pauley, sow; C. Bentley, sow. This breed of hogs is new to California, but those trying them have found them most profitable especially on years when feed is high. Their very rapid growth and quick development on probably the smallest amount of feed required by any breed of hogs brings them up to market requirements at the smallest expense.

Elmer Lamb of Ceres reports sales of pedigreed stock since the state fair last September: To C. J. Boyd, two bred gilts; John Estillarte, two gilts and boar; Sadie B. Fowle, boar; Sydney Smith, bred gilt; E. W. Beebe, two gilts; D. Power Boothe, bred gilt; H. J. Sherwin, sow and seven pigs; Andrew Schendel, service boar; J. H. Layman, two gilts and boar; Jack Mongovan, boar and gilt; Clifford Farms Co., service boar; F. E. Dickie, three bred gilts; F. S. Ingram, boar; H. P. Jorgensen, bred gilt; Geo. E. Spencer, one bred gilt, two open gilts; Berglund & Sundstrum, service boar; L. A. Welch, service boar; S. P. Summers, gilt; Chas. L. Metzger, boar and bred sow; L. S. Pardee, sow and nine pigs; V. C. Hague, gilt; A. J. West, gilt; A. R. West, gilt; C. J. Bucholz, three bred gilts; Ralph Lockie, bred gilt; Dr. Geo. A. Spencer, bred sow; Earl N. Dargitz, bred sow; Nicholas G. Jesch, service boar.

SAN JOAQUIN COUNTY COW TESTING REPORT FOR FEBRUARY

The noticeable feature of the report for February is the high averages obtained by F. J. Kell's herd. This is the result of better feeding together with fresh cows and milking the heavier producing cows three times a day.

Two of the members of the association have entries in the California state dairy cow competition, namely, the M. C. Gammon Estate and F. J. Kell. We are looking to these people to help put this county on the map in the dairy world.

Following are the five leading herds in butterfat production for the past month, giving name of owner, nummer of cows in herd and average pounds butterfat: F. J. Kell, 13, 37.8; R. W. Fisher, 19, 28; M. C. Gammon Estate, 26, 27.1; J. L. Bruml, 17, 25.7; C. H. Keyes, 13, 25.5.

Following are the five leading herds in milk production for the past month, giving name of owner, number cows in herd and average pounds of milk: F. J. Kell, 13, 1048; M. C. Gammon Estate, 26, 751; County Farm, 30, 721; C. H. Keyes, 13, 704; E. B. Goodwin, 51, 702.

FAT HOG AUCTION AT WASCO

By Farm Adviser Geo. Kreutzer

ON March 10 the second fat hog auction sale was held at Wasco under the auspices of the farm bureau. In all about $9,000 worth of fat hogs were sold, being a total number of 450, or about five carloads. The top price for these hogs was $12.70 per hundredweight in carloads, and others sold at $12.62½, $12.60 and $12.50. A few very light hogs brought less than 12 cents.

The idea of this auction is to bring all the hogs to a common point, within driving distance of the farms, have cars ready for shipment, and notify the buyers to come where they are given an opportunity to purchase competitively. We believe the auction was a success in every way, that the prices realized were satisfactory to the farmers, and that the buyers got stock that was desirable for the prices given.

refund, to those who sold fat stock.

It is the intention of the farm bureau to spread this system all over the county, providing it meets with the success in the future that it has in the past two sales. It seems to be a system in which a minimum of trouble is involved and where stock are sold purely on their merits and in accordance with supply and demand. As soon as possible we are going to try and do some real, careful grading in order that the fine stock will be separated from the others, and in that way the men who produce some of the good articles as well as some that are not so good will see how the buyers discriminate in prices between the two kinds, and thus serve as an education in stock feeding.

We will probably hold our next sale at Wasco on April 14, and perhaps one other point where sufficient stock may be obtained to make carload lots.

CHANGED DATES

Sale dates of Stephenson Holstein herd, Lake Mills, Wisconsin, April 6 and 7. Lake Mills Holstein Breeders' Consignment sale May 8 and 9.

PROTECT YOUR CATTLE WITH

Blacklegoids

NO DOSE TO MEASURE.
NO LIQUID TO SPILL.
NO STRING TO ROT.

BLACKLEGOIDS are small pills. Each pill is an accurate dose of blackleg vaccine.

BLACKLEGOIDS are easily administered—simply inject them under the skin with a vaccine injector.

TAKE NO CHANCES.

Don't wait until your calves become infected. This means certain loss—there is no *cure* for blackleg. Vaccinate now—before the deadly disease shows itself.

THE COST IS SMALL.

BLACKLEGOIDS are economical. The expense is trifling compared with the loss you are liable to sustain if you do not use them.

ORDER THROUGH YOUR VETERINARIAN OR DRUGGIST.

Write for free booklets on Blackleg, with full information about Blacklegoids.

Skin Disease in a Horse

I have a mare that rubs her mane and tail very badly. Every spring and during the summer her neck, breast and belly get almost raw. She is only rid of it about three or four months in the year. Have fed her sulphur and used sheep dip with very little effect. —Subscriber, Fresno.

Such cases as you describe usually require both internal and external treatment. Give the mare a handful of epsom salts in her feed once a day for three or four weeks. Also get a quart of Fowler's solution of arsenic and give one ounce once a day while it lasts. Better begin by giving half ounce doses for the first few days and end in the same manner. For the external treatment scrub the irritated parts once with soap and warm water and rinse the soap out with clear water. Then wet the parts once a day with a solution of chloride of zinc, one and a half ounces to the gallon of pure water. Better warm the amount of the lotion that you use each day just before applying it.

When to Castrate Pigs

When is the best time to castrate pigs; before or after weaning?—Subscriber, Wheatland.

A good time to castrate pigs is when they are about three weeks old or any time up to the time they are ten or 12 weeks old. If done while they are running with the sow they seem to mind it less.

Feed for a Calf

Is a mixture of beet pulp and bran good for a calf when it begins to eat grain and hay, and if so what proportion of bran should there be to the beet pulp?—Subscriber, Wheatland.

A little beet pulp and bran, equal parts, might be all right to feed a calf, but much of it would probably cause indigestion and scours.

Fitting Stallion for Service

I have a stallion that I wish to feed up preparatory to the breeding season. He is fat and full of life, but does not seem to be just right for service, being a little sluggish. What shall I give him in the line of medicine and feed? —Subscriber.

It is rather late in the season to begin to fit a stallion for breeding services but here in some general advice that will help some now and do more good for the next season. There is no medicine that will adjust things at once because the whole system must be right first. You say he is fat and I take it for granted that he has had very little exercise, for that is the usual way of caring for stallions. These very conditions cause many stallions to fail in the breeding season. Poverty and hard work precede the strongest generative activities in all animals. I realize that the men who have mares to breed want to take them to a fat, handsome horse; and no horse is handsome unless he is fat, so you must have him in good condition, but the flesh must be put on while he is sparingly fed and accompanied with plenty of hard work. I think you will see the point and realize that it can not be done in a few days. A stallion should have an acre paddock to run in all winter or have a brisk drive of at least ten miles a day and be well rubbed down when he comes back. The best feed is; not too much hay and a liberal amount of oats, say one pound of oats for each hundred pounds of the weight of the horse every 24 hours. There is no feed for a horse that is equal to oats.

Now for your horse, do this. Commence driving him a few miles every day, and in a week get it up to about ten miles a day. Rub him out well on his return and cool him out carefully so he will not get sore muscles nor catch cold. For feed give him two pounds of hay in the morning and at noon and ten pounds at night and oats as suggested above.

To get his system in good shape quickly give him this physic: Aloin three drams, powdered nux vomica two drams, turpentine two ounces and raw linseed oil one pint. Mix and give at one dose. Do not drive him for two days after giving the physic or it may work too strong. Also give these powders: Gentian four ounces, nux vomica three ounces, sulphate of iron one ounce and farina eight ounces. Mix. Divide into 32 powders, giving one in the feed morning and evening. If you will break a raw egg and mix it shell and all in his feed morning and evening I think it will pay well. Try it.

Heaves

I have a mare nine years old that I think has the heaves. She eats well but breathes hard and coughs a great deal. She is in the pasture during the day and is fed wild oat hay, and twice a week is given a bran mash. She does no work except driving and that not often. After being driven she finds it difficult to breathe and is obliged to stop to get her breath. Have been giving her some oil of tar but would like to know if there is any cure, and what it is.—Subscriber, Porterville.

Heaves is uncommon in California but a few horses have it very hard. Avoid as far as possible working her on a full stomach. Give the heaviest feed at night and light feeds during the day. Get these powders of your druggist and feed them carefully as directed: Powdered belladonna leaves four ounces, powdered digitalis leaves four ounces, powdered nux vomica two ounces, ground gentian four ounces, arsenious acid two drams and farina six ounces. Mix. Give a heaping teaspoon morning and evening. Mix the medicine with some kind of ground feed.

Fails to Breed

My three-year-old heifer came fresh last June and is doing fine, but after breeding her twice she still comes in heat every four weeks. Please tell me what to feed her to bring her around right and if it will hurt her if she should be with calf.—Subscriber, Alpaugh.

Cows Retain After-Births

Can Be Made to Clean Easily and Promptly Without Manual Labor

When cows do not clean after calving, you think of two things, and you should suspect another—more serious.

You will think first of the dirty job on your hands, then that you may lose your cow. It also indicates a germ infection that is likely to run through your entire herd with serious losses.

Our Government and other authorities agree that retention of afterbirth, premature calving, sterility, contagious garget, calf scours and calf pneumonia, are symptoms indicating presence of germs which cause abortion. They agree, also, that the infection can be controlled—the loss of calves and damage to cows stopped.

This can only be done by the use of a safe, powerful, non-poisonous, powerful germicide, Bacili-Kil, (B-K for short). It dissolves the slimy, albuminous matter in the uterus, brings the afterbirth, destroys the germs and bad odors, heals the tissues, leaves everything clean.

B-K is scientifically correct for this work. It does not irritate, but is soothing and healing to the torn membranes, and does not cause straining. Other things, such as carbolic acid, cresol, and other coal-tar products, iodine, etc., tend to irritate, do not dissolve the slimy albumins, but tend to coagulate or thicken them, thereby preventing destruction of the germs and cleansing of the infected tissues. B-K may also be used freely in the drinking water. It helps to destroy accumulating germs in tank, also disinfects mouths, throats and digestive tracts.

The remarkable germ-killing strength of B-K is printed and guaranteed on every package. B-K contains no poison, acid, nor oil. B-K is handy. You have in one jug, always ready by just mixing with water, your treatment for cows, bulls, and calves; also, the cleanest, safest and best disinfectant for general use. No mixing of various ingredients—saves trouble and mistakes, insures promptness, accuracy, convenience, successful results.

Leading breeders bear ample testimony of the valuable aid received from B-K in treating retained afterbirths and similar ailments of cows. One breeder says, "I have found B-K the greatest thing ever for cows that do not clean readily. This is a job I have always had to do by hand, but now by injecting B-K dilution, never knew it to fail to bring all things right before the fourth day.

B-K is sold by dairy and farm supply houses, druggists, general stores, etc., everywhere. If your dealer doesn't carry it, send us his name. Dealers wanted in every town.

Write us for additional testimony from users, and the reasons why B-K is so uniformly successful in this work. Send for bulletin

INNISFAIL DAIRY SHORTHORNS

GLENSIDE ROYAL 408155.

Our herd of registered Shorthorns has been carefully selected from the leading milk producing strains of the breed and is being developed along the same lines in our hands.
The herd is headed by

GLENSIDE ROYAL

a prize winner at the 1913 International and grand champion at Panama-Pacific Exposition.
Sired by him and out of large cows of good milk production we offer for sale a few choice young bulls.
Our entire herd is tuberculin tested.

Alexander & Kellogg, Suisun, Cal.

Farm on Grisly Island.

Purebred Registered

HOLSTEIN CATTLE

Twenty million dairy cows in the United States, and five million of that number unprofitable! Surely one great public benefactor is the dairyman who by changing bad cows for good, seeks to produce two quarts of milk in place of one produced before. This progressive type of farmer, all over the continent, is either grading up his common cows with a purebred Holstein bull, or he has already installed the profitable purebred registered Holstein cows in his barns. He is adding to the wealth of the nation and to himself as well. Slowly, but surely, proper understanding will eliminate the unprofitable dairy cow.

When writing advertisers, mention the Cultivator.

Feed her light on any feed that you may have and give these powders: Powdered gentian three ounces, powdered nux vomica two ounces, sulphate of iron two ounces and farina five ounces. Mix. Give a large tablespoon of the medicine in the feed twice a day. Give her a drive of several miles to get her well warmed up just before breeding her next time.

Loss of Flesh

We have a seven-year-old mare that is very thin in flesh. She has a good appetite but what she eats does not seem to do her any good. She was formerly a good traveler, but now seems to have no life nor energy. Am feeding her alfalfa and wheat hay and also giving her bran twice a day with some stock food in it. For a while she passed bloody urine but have seen nothing of that for quite a while. What is best to do for her?—Subscriber, Tulare.

First give her a physic of aloin half an ounce, powdered nux vomica two drams, turpentine two ounces and raw linseed oil one pint. Mix and give at one dose. Follow this by giving these powders. Powdered gentian four ounces, powdered nux vomica two ounces, nitrate of potash four ounces, powdered rosin half an ounces and farina six ounces. Mix. Give a tablespoon of the medicine in the feed morning and evening. Bran is not good feed for horses. Rolled barley is much better.

Drying Off Cow

Cow had calf nine days ago, after being dry for some two weeks. When I commenced to dry her up she was giving about two gallons a day and I got her down to half that amount and then stopped milking her. She had milk in her bag all the time but not enough to cause her any discomfort. Since calving she has not given as much milk as she did before, only about a gallon and a half a day. She seems healthy, has a good appetite. About two-thirds of the milk comes from one quarter of her udder, the rest being soft and empty. She has ample udder for a three or four-gallon cow. This is her second calf. I am feeding about ten pounds of ground beans and oats a day. She is out on good green feed and has a little hay and all the bean straw that she can eat. Would you expect her to come up to a normal flow or is she apt to be no good for the balance of this milking? Is there anything that I can do to bring her up to what she should be?—Subscriber, Ventura.

For several years the writer of this column has advocated milking a cow that wants to give milk right up to the time of coming fresh again. For years the efforts of the dairymen have been to raise cows that would give a large flow of milk and keep it up for a long time. They have so far succeeded that some cows are veritable milk machines and once started can hardly be stopped. Most cows will stop giving milk for some time before coming fresh in spite of all efforts to keep up the flow, but in all cases it is quite a shock to the system to change the flow of blood from the uterus, where it has been going to supply the circulation of the calf, to the udder to supply food for the new-born calf. If the flow of milk continues right through the period of gestation why not encourage it and thus avoid at least a part of the shock that must come. When a stoppage is forced, as in this case, we often see bad results such as you describe. Some cows stand the sudden change all right but others can not. Now to try to get the flow of milk started again; feed plenty of sloppy feed and milk regularly. Rub and manipulate the udder for some time before and during the milking. Medicine will do very little good in her case.

Raise Your Calves on

Blatchford's Calf Meal

and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.
Prevents scouring and insures the early maturity of sleek, handsome calves.
It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 8 Waukegan, Ill.

Artificial Lighting of Laying Pens

By J. E. Dougherty, Professor of Poultry Husbandry at University Farm, Davis

FOR some time requests have come to the poultry division of the University of California for information as to the real value of artificial lighting upon egg production when such lighting is used to prolong the working day of laying fowls during the short days of winter.

The idea of using artificial lights is based upon the following beliefs:

That other things being equal and making due allowance for the effect on production of the spring breeding season and the molting period, fowls of good egg producing ability exercise, consume feed, and lay eggs approximately in proportion to the length of the working day.

That if the working day in summer is a criterion, artificial light might be used to advantage in winter to make the winter working day equal in length to the summer day.

A number of successful poultry farms were visited where artificial lighting was evidently giving good results. Finally, at the poultry division of the University Farm at Davis a pen of 123 S. C. W. Leghorn one and two-year-old fowls was started on a preliminary test on November 19, 1916 to determine if an extended investigation of this sort would be worth while.

The lights were first turned on at 5 p. m. November 19 and thereafter lighted at 5:15 a. m., turned off at daylight, lighted again at dusk, and put out at 9 p. m. daily. The following table clearly shows the effect that the use of artificial lighting has had upon the pens in which it was used:

	Percentage—					
Two week period ending	Dec. 3	Dec. 17	Dec. 31	Jan. 14	Jan. 28	Feb. 11
Lighted pen No. 1	6.75	52.1	63.7	56.9	53.1	57.8
Lighted pen No. 2		2.7	35.3	55.4	54.7	57.6
January pullets	28.2	30.9	45.4	39.4	45.0	67.0
February pullets	32.3	25.6	37.6	31.0	37.7	61.7
March pullets	21.0	27.0	35.8	28.7	42.4	61.5
Average of flock of 1700 layers omitting lighted pens	9.0	14.0	20.1	20.2	23.3	40.0

Began using electric lights in lighted pen No. 1 November 19, 1916. Began using electric lights in lighted pen No. 2 December 12, 1916.

Because of the remarkable increase in egg production from week to week following the use of electric lights, it was thought advisable to check the results secured with the first lighted pen by lighting another similar pen in the same way. So on December 12, 1916 another pen of 94 S. C. W. Leghorn hens two to four years of age was lighted artificially before daylight and after dark with the results as clearly set forth in the above table.

The only facts brought out by our investigation to date are that the use of electric lights has increased production as shown in the table with small increase in feed consumption. Using two 50-watt Mazda lamps for 100 fowls for an average of six hours per day at four cents per kilowatt would cost 2½ cents per day.

An increase from 20 per cent to 60 per cent production, with eggs selling at 40 cents per dozen in December would mean an increase in gross income of 41 cents per hen, or $41.33 per 100 laying hens. From this gross income would have to be subtracted the cost of lighting and the additional feed consumed. The latter has not been determined as yet, but would undoubtedly be considerably less than the value of the increased egg production.

While the preliminary results of an investigation of this kind as set forth here cannot be taken as in any way conclusive, yet they not only furnish much food for thought but amply justify further extended investigation as to what effect artificial stimulation will have on the normal egg production for the rest of the year.

Yet to be determined are the following points:

If increased egg production induced by artificial lighting will have an injurious effect upon the health of the fowls or upon the fertility and hatchability of the eggs set, as well as the strength and vigor of the resulting chicks.

If the use of artificial light only before daylight, or only after nightfall, will give as good results as such lighting both night and morning.

How many and what hours each day and for what period of time artificial lighting can be most profitably used.

If artificial lighting can be safely used to stimulate the laying of breeding hens whose eggs will be used only for the early hatches.

How soon after beginning the use of artificial lighting in any given winter the hatching eggs begin to show the injurious effects of such lighting.

Rice as Poultry Feed

ANSWERING a question of a Cultivator subscriber, W. E. Lloyd, of the Poultry Husbandry Department of the University Farm, Davis, writes:

"Rice analyzes from 1:12 to 1:14, that is rice contains one part of protein to from 12 to 14 parts carbohydrates and fat. This is what we call a wide ration and means that the amount of carbohydrates and fat is very high.

"For laying hens the ration is entirely too wide and would necessitate balancing up by some high protein feed. In addition to the large amount of carbohydrates the grain is very hard and would seem to be a better feed if it were soaked or cooked for the fowls. The rice as it comes from the field, known as paddy rice, contains a very large amount of crude fiber in the form of hulls. In addition to the crude fiber there is a large amount of silica. This is said to do considerable damage to the digestive system of certain animals.

"We have not experimented as yet with rice here at the station, but expect to do so within a short time. We know of some poultry men who are feeding rice in the proportion of one part paddy rice, one part wheat and one part barley, as a grain mixture, and seem to be getting good results. However they are running no checking pens and do not know what the effect really is.

"Paddy rice, rice screenings and unpolished rice might be advantageously used in a laying ration to the extent of not more than one-third by weight of the grain mixture, if such rice can be bought at low enough prices to more than compete with common poultry grains.

"Rice bran containing no hulls and not less than ten per cent crude protein and six per cent fat and not more than 20 per cent fiber (guaranteed analysis), as well as rice polish and ground rice, may also be economically added to the mash mixture if it can be purchased at less cost than similar and more common feeds during periods of high prices. Such rice feeds should not be used to a greater amount than 20 per cent (25 per cent maximum) of the total grain and mash ration, or 20 per cent of the mash alone.

"Rice feeds are very starchy and quite fattening in character. They have a high oil content and ground rice feeds are apt to turn rancid in a short time. They must therefore be handled and fed with care.

"Pure rice bran and rice meal do not moisten readily when spread on the surface of water. If, however, they are adulterated with hulls, the hulls will soon sink to the bottom. Such hulls are practically worthless for poultry feeding."

The Pride of Petaluma Fresh Air Brooder Stove

Well, here we are again, and our No. 20 catalogue is now ready for you. It's a HUMDINGER, and if you are interested in poultry you should have it. It's full of splendid information about brooding in bunches from 300 chicks on up with the brooder stove system. If you are satisfied with your present brooding system, get our catalogue and learn how you can BEAT IT. If not satisfied, GET OUR CATALOGUE No. 20, it will put you RIGHT. Thirty-One Cents Profit per Hen in February

By C. T. Patterson, Director Missouri Poultry Experiment Station

WE often hear the question asked, "What can be made from poultry?" In answer to this question we give the results for February from a commercial viewpoint of the egg laying contest conducted by Missouri Experiment Station at Mountain Grove.

The results of five previous contests indicate that the average production for February is the average per month for the year. While the price of eggs was above the average, price of feed was correspondingly high.

As one man does all the work in the contest, it furnishes a basis for finding the relation between cost, labor, profits, etc. In doing the work of feeding, watering, trapnesting, etc., the man passes through 756 gates and doors each day, as well as keeping 58 mash hoppers in repair, cleaning 58 droppings boards, and keeping the litter in order in 58 houses. Thus it will be seen that the man has a maximum amount of labor, and as he has charge of 58 pens of six hens each, five competing and one substitute, 348 hens, he has a minimum number of hens, and as February is the shortest month of the year, we believe the profits to be below the average.

The feed for February cost $71.34, or 20.5 cents per hen, and 16 egg cases at 25 cents each cost four dollars, making a total cost of $75.34. Five thousand five hundred and twenty-eight eggs were produced which sold at an average of three and one-third cents each, or $184.26, leaving $108.92 for labor. This is an average of 31 cents per hen, which was more than one cent profit per hen per day.

One man can care for three or four times as many hens where they are kept in larger flocks, which makes the profits greater.

We believe proper feed and care is partly responsible for large egg yields. We have no secret formula for feeding, but have published our feed ration through these columns and will send circular entitled, "Balancing the Ration for Egg Production", free upon request.

The Contest

The 290 competing pullets produced 4732 eggs during February, or an average of 16.3 eggs per hen, which is the best average ever produced at this place during February—12.8 eggs was the average for the five previous contests.

A pen of Buff Rocks from Kansas won the cup for February by laying 106 eggs.

The pens occupying the five highest places for February are as follows: Buff Rocks, Kansas, 106 eggs; S. C. W. Leghorns, Pennsylvania, 103 eggs; White Rocks, Missouri, 100 eggs; S. C. Reds, Missouri, 98 eggs; Partridge Rocks, Ohio, 97 eggs (tie); White Wyandottes, Missouri, 97 eggs (tie); Columbian Wyandottes, New York, eggs (tie).

A White Wyandotte hen holds the highest record to date by laying 103 eggs in the four months.

The ten highest pens to date are as follows:

White Wyandottes, Missouri, 393 eggs; R. C. Rhode Island Whites, New Jersey, 386 eggs; White Wyandottes, New York, 351 eggs; Buff Orpingtons, Missouri, 343 eggs; White Orpingtons, Missouri, 338 eggs; S. C. White Leghorns, Missouri, 330 eggs; R. C. Reds, Missouri, 327 eggs; S. C. Buff Orpingtons, Missouri, 320 eggs; R. C. Reds, Missouri, 318 eggs; S. C. Reds, Iowa, 309 eggs.

Preserving Eggs Satisfactory

The waterglass method of preserving eggs is proving entirely satisfactory. Eggs have been kept in the solution for three years without any observed deterioration.

Directions

The waterglass, or sodium silicate, can be secured at any drug store. Some of the cheaper grades contain free alkali which gives a tinge of pink to the whites of preserved eggs, therefore effort should be made to secure the best quality of sodium silicate from a reliable dealer. The usual solution is made of one part of waterglass to twelve parts of water and the water should be boiled before making the solution as the freshly drawn water contains quantities of carbon dioxide. The boiled water and water glass are thoroughly stirred and set aside to cool when it is ready for use.

Containers

A recent circular published by the Washington experiment station gives the following table of containers, number of eggs held and amounts of waterglass solution required.

Any receptacle that is impervious to and does not corrode in water is suitable for holding the eggs and water-glass solution. Generally, glazed earthenware jars, galvanized tubs or buckets and wooden tubs or kegs are used. In case of wooden receptacles it is desirable to let them stand filled with water several days, then empty and scald before using.

The size of the container will depend upon the number of eggs to be preserved. The receptacle should be just large enough to hold the eggs submerged in the water-glass solution. A larger container means an unnecessary expenditure and wastefulness in the use of the water-glass solution.

Container	Will Hold	Water-glass Required
1 gallon....	40 eggs....	3 pts., 10 ounces
2 gallon....	80 eggs....	7 pts., 3 ounces
3 gallon....	120 eggs....	10 pts., 13 ounces
4 gallon....	160 eggs....	14 pts., 6 ounces
5 gallon....	200 eggs....	18 pts., 0 ounces
10 gallon....	400 eggs....	36 pts., 0 ounces

Water-glass appears to have modified the albumen to a slight extent, but not to such a degree as to be undesirable for good purposes. With the exception of poaching, such eggs can be used instead of fresh ones, for frying, boiling, scrambling, cooking, as well as various other ways. When it is desired to boil them, a pin-hole on the blunt side of the egg should be made, because of the fact that the shell openings are all closed by the sodium silicate in this solution, together with the pressure developed within the egg during the process of boiling, causes the shell to break. In all instances, wash the eggs in water before using.

All Northwest Egg Laying Contest

The state college at Pullman, Washington, which is conducting the All Northwest Contest, has sent out summary of winter egg production of pens in the contest, up to February 28, 1917:

"The birds have laid 5007 eggs. The average winter egg production has been 50.07 eggs per bird. The average egg production has been 36.5 per cent. The profit estimated over feed has been $1.30 per bird. The breeds are White Leghorns, White Orpingtons, Rhode Island Reds, White Wyandottes, White and Barred Rocks and White Minorcas.

"Our 20 best hens laid 1512 eggs. Their average winter egg production has been 55 per cent. Their average winter egg production has been 75.6 eggs per bird. The profit (estimated) has been $2.24 per bird."

Feeding Bees

Written for California Cultivator By G. W. Bercaw

FEEDING bees is a necessity sometimes in order to carry them through an apparent honey famine. There are many plans put forward as to how to feed bees without serious results from outside bees or from robbing. It is difficult to lay down any fast rule; experience along this line coupled with good judgment will be one of the very best teachers. A person must be extremely careful in feeding and not expose feed of any kind so as to start robbing. A good plan is to put an extra super on the colony and set your feeding pan on the inside, taking care that it is perfectly tight. Do this along towards evening, putting some small pieces of wood in the pan for support for the bees. A good feeding syrup can be made with two quarts sugar to one boiling water, thoroughly dissolving the sugar by stirring; adding a small amount of salt, very little; the amount to feed will depend upon how much they need. The beekeeper will have to be the judge, allowing the bees any benefit of doubt.

The Italian Bee

That the Italian bee is the best strain or race of bees for honey gathering qualities, gentleness, prolificness and disease resistance, is becoming well known among our scientific beekeepers. The Carniolan, which is of a grey color, would be equal to the Italian if it were not that they are more inclined to swarm and often breed up when there is no honey flow. The writer has tried both the Carniolan and the Caucasian, having imported a Carniolan queen two years ago from upper Carniola, Austria, but is thoroughly convinced that the Golden Italian bee is the best all purpose bee.

The last few years, having kept a few colonies of the three races of bees I have mentioned, I am thoroughly convinced that the Italian bee is the best all purpose bee we have. I quite often hear a beekeeper say the moth bothers his bees. I will say I do not remember ever seeing or hearing of a colony of full-blood Italians ever being destroyed by moth. They keep the colony not only healthy but full of bees and will not hesitate to tackle a full grown moth when she comes near the entrance of the hive.—Beekeepers Review.

CALIFORNIA BEE NOTES

By Chadwick in Gleanings

If no moths are allowed to hatch in neglected combs they will get pretty scarce in a short time.

It is a great deal better to have a lot of supplies ready that you do not need than to need a lot that you do not have ready.

A man who can be trusted to do the right thing when no one is looking at him is the kind of man to have at an out-apiary.

There was less pollen brought into my hives during December and January than at any time for 13 years during the same months.

January ended the fourth consecutive month with the mean temperature below the average. It was even colder than December. There were 24 days when the minimum reached below 40 degrees; ten days when the minimum was down to the freezing-point and below, and 20 days when the maximum did not reach 60 degrees.

If you find a colony destitute in cold weather, do not try to feed the bees thin honey or syrup, but give them pure thick honey or very heavy syrup. They have to put in a lot of work on thin feed, reducing it, and that makes undue excitement, which is not desirable in cold weather. Thin syrup is all right for stimulating—the thinner the better so long as they will take it up.

The county bee inspector of Los Angeles County has been placed under civil service, and all deputy inspectors must pass an examination. This seems like an excellent idea, at least so far as getting competent inspectors is concerned, provided the examination is up to a high enough standard. It won't put "pep" into an inspector, however, and that is really an important qualification for this office.

During March the apiary should be carefully inspected to locate any disease that may appear. If a few colonies are found that show disease, make them safe by leaving only a very small entrance until they can be cared for. If American foul brood appears, melt up the combs at once, and be sure that the bees do not get into other hives before you kill them. If it is European foul brood, and there are only a few colonies, it is cheaper to melt them up also. If a number of colonies have it, then treatment may be the most desirable. If you do not know disease when you see it, get your inspector to help you. He will willingly do it, for that is his business.

There seems to be an impression prevailing that a queen raised under swarming conditions, which may be said to be natural conditions, is superior to one raised through other inducement. Personally I cannot see why that should be the case. If larvae are transferred at the proper age, and a colony given cells after all of their brood has been removed, the nurse bees will literally flood them with royal jelly, give them every attention desired, and draw the cells out long enough for the most particular persons. It must be true that the majority of queens sold on the market are raised outside of the swarming season, yet the beekeeping public seems to be very well satified with them, and they seem to be giving good satisfaction.

Many beekeepers are waking up to the fact that their bees have consumed more than the average amount of honey during the past four months, while many colonies were left with only the average amount to begin with. The result is what might be expected—reports of heavy losses from various localities, which losses are due entirely to the lack of sufficient stores to feed them properly. It should be an object lesson to those who have been the sufferers; but the chances are they will soon forget and be caught in the same trap before many years pass by. Better think the following over and write it on the honey-house door: "Nothing is lost by leaving plenty of honey in the fall; for if your bees do not need it, it will be there the following spring, and you will get it anyway. If they do need it, they need it bad."

WHAT TO WEAR IN THE BEE-YARD

Do you wear black in the apiary during the hot weather? Try wearing a pair of white overalls and jacket and note the comfort. I have learned that the wrist is a bad place to get stung, and I avoid it entirely by wearing a sort of sleeve protector made from eight or ten-ounce canvas which extends from the palm of the hand to the elbow. I make it to fit snugly about the palm with a slit for the thumb. I fasten it with a safety pin to the sleeve.

Life Estate

M has taken care of A for six years under the understanding that upon death of A, M would receive all of her property. Wills and a deed to that effect have been made by A, but the deed has not been recorded. A is becoming childish and is giving away things she really needs to keep. A also claims the right to do as she pleases with her property. What means has M to protect herself?—Subscriber.

Cases such as the above are really quite difficult to handle unless the party desires to take action to enforce her rights. You are, of course, entitled to bring action in the appropriate court setting forth the contract which has been made, demanding the judgment of the court to enforce said contract. In the contract as established, as stated above, A has no interest in or to her property other than a mere life interest. The reversion of the real property and the title to the personal property in a measurse is vested in M subject only to the use thereof by A during her lifetime. If it is your desire to take proper legal proceedings, you can adequately protect your rights. Otherwise, it would be difficult to do anything other than inform the people to whom these gifts are made or promised of your rights in the matter. If the deed has been executed to M it would be only prudence to have it recorded.

Second Mortgage

I gave first mortgage on my farm, which became due January 1, 1915. The mortgage was foreclosed and property sold under execution June 1, 1915. The year of redemption right ended June 1, 1916. I had also given a second mortgage on the same property, therein stating that it was subject to the above first, which became due Aug. 1, 1915. No action was taken toward collecting the second mortgage although the security was worth far more than the amount necessary to redeem from the sale under foreclosure of the first, and the security was cut out by the first mortgagee acquiring title by court decree. Can the second mortgagee take judgment after making no effort to realize on his security?—Subscriber.

It undoubtedly would have been possible for you to have required the second mortgage to make due appearance in the foreclosure suit and have the property sold for the benefit of both, but at the present time it is exceedingly doubtful if anything can be done. However, the second mortgagee would be entitled to bring suit on the note, to secure the payment of which the mortgage was given, and take judgment thereon.

Husband's Debts

Husband bought life insurance stock, giving note for same. Wife has considerable property and husband none. Can company levy on wife's property for payment even if husband manages wife's ranch?

If property was deeded to wife by the husband prior to the execution of the note and the husband was solvent at the time, or if the property was acquired by the wife from other sources, the wife could not be held, as the husband in managing the separate property of the wife acts merely as her agent, and persons dealing with him are bound to take notice of his authority as in case of other agents; and the wife cannot be held for any contract made by him beyond the apparent scope of his agency.

Wife's Property.

A wife's father left her 400 acres of raw land. Husband placed mortgage on a small piece of it, took this money and went to work, developed water, built home, barns, etc., brought the land to a high state of cultivation. He also induced one of the big oil companies to develop oil on it. Now is it possible for wife to make a will, cutting him out of everything?—Subscriber.

In its inception the property was, of course, the separate estate of the wife, as to which the husband had no claim whatsoever. In some cases it is held that where the husband acts as agent for the wife in regard to her separate property he is entitled to reasonable compensation, the same as any other agent. In other cases it is held, however, that if the husband voluntarily gives his time and skill to the management of his wife's separate estate, or bestows his labor thereon, there will be, in the absence of any express agreement for compensation, no obligation on her part to pay him. It depends entirely upon the exact facts in each case, and the statement given is not, nor can it be in an opinion of this character, sufficient to give an adequate answer to a question as important as that to the parties involved. The wife, of course, is entitled to make a will devising all of the property to whomsoever she may desire. The only question would be as to the right of the husband to compensation for his efforts spent in the development of the property.

Community Property

Husband buys a piece of land and sells without his wife signing the deed. Can his wife get half of the land, or what part of it can she get? There were three children of age at time he signed quit claim deed.—Subscriber.

All property acquired after marriage by either husband or wife is community property. The husband has the management and control of the community property with absolute power of disposing, other than testamentary, as he has of his separate estate, provided he cannot make a gift of the community property or convey the same without a valuable consideration, unless the wife consents thereto in writing. Under the above provision it is legally unnecessary to obtain the signature of the wife to any deed to the community property and she is entitled to no portion of it during the lifetime of the parties or until the dissolution of the marriage either by death or divorce. The title companies, however, usually request the signature of the wife upon any deed for their own protection.

Property of Unmarried Woman

Am told that an unmarried woman holding property in California can't bequeath her property to other than immediate heirs and that a portion of her property passes to the state. What are the rights in this case?—Subscriber.

An unmarried woman is entitled to bequeath her property to anyone whom she may desire, either immediate heirs or those who stand in no relation whatsoever to her. No portion of her property passes to the state unless she dies without leaving a will and has no heirs.

Right of Way

A owns 20 acres of land, has four neighbors surrounding him, and to get to the county road has to pass over one of his neighbor's land. Now the neighbor whose land he has been passing over has built a fence and

FAIRBANKS, MORSE & CO., Chicago

warned A not to trespass. What can A do to get in and out of his place? Can the neighbor stop A from driving across his land to the county road?—Subscriber.

When there is a conveyance of land and there is no means of access thereto or egress therefrom except over the remaining land of the grantor, a right of necessity over such land is granted by implication of law. The general principal under which this right operates in case the grantor has conveyed away the land surrounding the enclosed piece is based upon the presumption that the grantor intended to reserve a right of way of ingress and egress to the enclosed land over the piece last conveyed. This is subject to the modification that where an easement was in use over other lands even though conveyed prior to other lands of the grantor. It is also, of course, possible that a right of way has been obtained over certain lands by prescription, in which case the owner of such lands would not be entitled to bar the way.

Collecting Wages

A buys retail dairy of B, giving deed of trust and $1700 borrowed of C, which is secured by chattel mortgage on the 18 cows and the deed of trust. A soon has no money, credit or hay and gives C a bill of sale for the cows and business. C buys the hay and keeps things going with A in charge. At the time A gave C the bill of sale for the cows he owed D $130 wages for milking. Later A paid D with C's money. D continued to milk. When C had owned cows 60 days he refused to pay D his wages, saying that any of his money paid to D by A must be credited to him (C). Can D force C to pay him? A judgment against A would be worthless as he has nothing. —Subscriber.

It is probable, from the facts stated, that A was continued in charge of dairy as the general agent of C, and as such he, of course, had the authority to employ C. In fact, from the circumstances, it appears that such employment was to an extent ratified by C. Such being the case D would be entitled to judgment against C for the value of his services. C, in order to relieve himself, should have properly notified D, but from the fact he did not he apparently encouraged D to continue work.

TYPHOID FLY FACTS

The following questions and answers are sent out by the Missouri College of Agriculture.

1. Where do young flies live? In filth and manure.

2. Where do flies first dirty their mouths and feet? In every kind of filth imaginable.

3. Is anything too dirty or bad smelling for flies to eat? No.

4. Where does the fly go when it flies from the vault, the manure pile or the spittoon? (a) It may wipe its feet upon the clean lips of your sleeping baby; (b) It may carry germs into the open wound on your hand; (c) It may track over the butter, the meat, or take a bath in the milk.

5. Is the fly merely a nuisance? No. It is very dangerous.

6. Why is the fly considered dangerous? It is man's worst pest. It is more dangerous than rattle snake or tarantula. It carries deadly infectious diseases.

7. What disease does the fly carry? It carries typhoid fever, tuberculosis, and various intestinal diseases.

8. How does the fly carry disease germs? The germs stick to its legs, mouth-parts, hairs, wings and feelers.

9. What is the correct name of this human pest? The Typhoid Fever Fly.

10. Has it ever caused anyone's death? It killed more American soldiers in the Spanish-American war than all the weapons of the Spaniards. It has killed thousands of soldiers during the present European war.

11. Why is typhoid fever so prevalent during the summer and fall? Because flies are most numerous during those seasons.

12. Why is typhoid fever common in one community and not in another? Largely because the common house fly is abundant in one locality and is controlled in the other.

13. Where are flies most abundant? Where there is most filth.

14. How shall we kill the fly? (a) Destroy all filth about the house and yard; (b) Put lime into the vault and over the manure; (c) Trap all flies before they enter your home by using wire fly-traps; (d) Kill all flies, large or small, with a "swatter"; (e) Use sticky fly paper or fly poisons around places where the fly may rear its the house or store; (f) Pour a borax solution over manure, filth or other young.

A few apricot orchards in the Banning district are reported to show frost damage, but most of them are unhurt.

SELLING THE COW

"She's an awf'ly good old cow. Our children think the world of her. You'll like her immensely."

"And how much milk does she give"

"Don't know exactly, but she's a nice cow—first class."

"Well, you must have some idea—does she give a gallon at a milking?"

"Never kept very close track."

"But you must have a rough notion about it. Does she give as much as half a gallon a day?"

"Couldn't say definitely. She's an awf'ly good, kind old cow, though. If she's got any milk she'll give it to you."

A SMALL PATTERN

She had been sitting in the furniture shop for nearly two hours inspecting the stock of linoleums. Roll after roll the perspiring clerk brought out, but still she seemed dissatisfied.

From her dress he judged her to be a person of wealth and thought it likely she would have a good order to give. When at last he had shown her the last roll he paused in despair.

"I'm sorry, madam," he said, apologetically, "but if you could wait I could get some more pieces from the factory. Perhaps you would call in again."

The prospective customer gathered her belongings together and rose from the chair. "Yes, do," she said with a gracious smile, "and ask them to send you one or two with very small designs, suitable for putting in the bottom of a canary's cage."

A teacher was one afternoon examining a class of young boys in geography. He said:

"Now, boys, what do you think that Noah did while he was in the ark?"

After waiting several minutes he saw one hand go up, and the little chap on being asked what he thought Noah did replied:

"Sir, I think that he might have fished some."

"Yes," said the instructor, "that is possible; he might have fished some."

Presently another small hand went up. The teacher asked this one also what he thought about it.

The small boy said: "I don't think that he fished very long, because he only had two worms."

Packs new furrows and stirs top soil to prevent evaporation

Stops Winter Killing
In early spring it settles down the heaved soil, resets the plant and fills up frost cracks.

Cultivates Crops
Firms soil about roots, stirs surface, breaks crusts. Wheels detachable for straddling corn.

Starts Seed
Firms soil around seeds to attract moisture and make them sprout quickly.

Retards Blowing
Ridges at right angles to prevailing winds retard wind from blowing the soil.

Hinders Weeds
In newly seeded fields will set back little weeds, giving crops a good start.

Levels Soil
Tears down high spots, builds up low places, making field smooth for harvest.

More Than A Clod Buster

The Culti-Packer with its two rows of heavy semi-steel wheels crushes the worst lumps into a fine mellow seed bed, but that is only *one* of *ten* farm jobs that it will do equally well.

The farmer who uses it right will have it in the field from early spring till late in fall for one purpose or another. He will use it on every crop he grows---for preparing the seed bed, starting the seed, cultivating the growing crop, breaking crusts, saving moisture.

Read this list of Culti-Packer jobs and see what noted farm authorities have to say about it---then go to your dealer and get acquainted with this tool.

Expert Opinion

Alfalfa
"On ordinary well plowed ground, the plow, spring tooth harrow and Culti-Packer are all that are needed to prepare a perfect seed bed. The Culti-Packer greatly excels any other implement we have ever used for this purpose."
Chas. B. Wing, Alfalfa Expert

Corn
"Every one about the farm is extremely enthusiastic over the use of this tool. We used it on corn ground after the corn had been planted. It seemed almost an ideal tool for this purpose."
Ohio State University

Wheat
"Rolling in the spring will compact the soil about the plant root and add vigorous growth of wheat. Since the Culti-Packer has come on the market we have come to favor it. During a period of four years, rolling gave an average increase of 5 bushels per acre."
Nebraska College of Agriculture

Oats
"Compacting is usually done with a smoothing harrow. A much better tool is the corrugated roller (Culti-Packer) which can be used instead of the harrow after disking and seeding."
Frank I. Mann

General Crops
"We are using the Culti-Packer on the experiment field here. It certainly is one of the grandest tools I have ever used on a farm."
Kentucky Experiment Station

"We have used one of your Culti-Packers with good satisfaction. In fact for certain conditions of soil it is one of the finest machines for preparing a seed bed we have ever come across."
N.Y. State College of Agriculture

Be Sure It's A Culti-Packer

The genuine Culti-Packer has the three features listed below:

1 **Quick Detachable Wheels** can be removed from axle in one minute, leaving a gap for straddling corn rows.

2 **Wheels Always Split Ridges;** an arm keeps the wheels of back gang in position to split ridges left by front gang.

3 **Dunham Roller Bearings.** The axle turns in steel roller bearings making the Culti-Packer pull easily with the average two horse team.

"SOIL SENSE" FREE BOOK

48 pages of fine soil photos and information on Root Growth, Seed Beds, Soil Moisture, Crop Cultivation, and special hints on many different crops.

FARM LANDS FOR SALE

Apricots Net $200 an Acre Annually in the foothills of Pajaro Valley. No irrigation, no frosts. We have to offer 200 acres ideal cot land, 2 miles from town and R. R. station; all now in two-year-old, thrifty apricot trees and adjoining full bearing cot orchards that have netted yearly for the past 8 years an average of $175 an acre. We can sell this in lots of 20 acres or more at $125 an acre and on easy terms. Nothing can beat this as an investment. It's better than life insurance. Write for full details, government soil survey, etc. Farm & Forest Realty Co., Watsonville, Cal.

For Sale—Orange County ranch, 167 acres with good improvements and in good state of cultivation. Water conditions excellent. Artesian wells and pumping plant both. Located ¾ mile from village of Westminster and ¼ mile from Orange County's fine highway running from Long Beach to Santa Ana. Property clear and title perfect, but on account of peculiar circumstances of ownership this land is for sale under value just now and never offered before. W. F. Marks, 226 S. Main St. Phone Main 1499, Los Angeles.

Attention, Mr. Dairyman—If you own a herd of good dairy cows and are now renting your land, we will sell you good alfalfa land, WITH NO PAYMENT DOWN, and with interest at 6 per cent payable annually. Water in abundance. Rental $1.00 an acre for season. Lands are U. S. Government irrigated, at Orland, Glenn County, California. A. B. Aitken (Selling Agent). (A resident of the valley since 1858). Dealer in Sacramento Valley Lands. 1701 "J" St., Sacramento, Cal.

For Sale—80-acre improved foothill ranch, 12 miles east of Porterville. 30 acres citrus land now in wheat; 15 acres alfalfa land; hog fencing; pasture; timber; river; railroad adjacent. Patents that protect are secured through the PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "PATENTS"

TOO MUCH SALT MAY KILL ANIMALS

Since salt is necessary to life and is in universal use it is difficult to realize that in large amounts it is poisonous. Many cases of poisoning in chickens have been reported and occasionally in larger animals. In one instance salt was by mistake used instead of sugar in making a cake. The cake was given to the chickens and killed all of them. Chickens are very susceptible to salt poisoning and, while the amount that it takes to kill a horse or cow is considerable, this sometimes occurs when these animals are especially salt hungry.

When animals have not had access to salt for a long time it is safer to give it to them sparingly at first.—I. E. Newsom, Colorado Agricultural College.

DAIRY CATTLE CONGRESS

The 1917 Dairy Cattle Congress will be held October 1 to 7 inclusive. Since its initial bow into the realm of dairying eight years ago, each succeeding year has witnessed a larger and more imposing exhibit of dairy cattle, dairy equipment, machinery and supplies.

The show will take place on its permanent grounds at Waterloo, Iowa, which has acquired the reputation of being one of the most important dairy centers not only of the Mississippi Valley, but the United States. The Dairy Cattle Congress is primarily an educational institution. Unlike the average fair, it has only one purpose, which is the development of the dairy industry.

FIRE AND WATER

The Morris & Snow Seed Company of Los Angeles suffered during the past week a serious loss through fire and the flood of water poured in by the fire department. Tons of high-priced seeds are now soaking in a basement full of water and other seeds and plants were destroyed by the flames. The firm has, however, transferred such goods as were saved to 526 South Main Street, Los Angeles, within a block of their former location. Before these words are read the new business will be in full swing again. Very fortunately all orders for goods were saved and customers are assured that they will be filled with only slight delay.

CITRUS TREES SELLING

There is brisk demand for citrus trees this year. The Wallace Nurseries, with office in the I. W. Hellman Building, Los Angeles, says that large orders are being received from all sections. Especially heavy orders are coming in from Ventura County. It is thought this will be one of the best planting seasons for years.

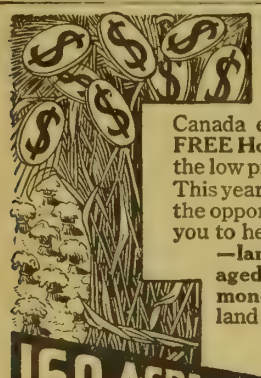
"Young man, the best tonic for you is the right kind of food. I suggest for Breakfast

Ghirardelli's
Ground Chocolate

It's easily assimilated — it's extraordinarily nutritious — and it is supremely delicious."

It comes **PROTECTED**—as all chocolate should—in ½-lb., 1-lb. and 3-lb. hermetically sealed cans.

Since 1852 D. GHIRARDELLI CO. San Francisco



Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her **FREE Homestead lands of 160 acres each** or secure some of the low priced lands in **Manitoba, Saskatchewan and Alberta.** This year **wheat is higher** but **Canadian land just as cheap,** so the opportunity is more attractive than ever. Canada wants you to help **feed the world** by tilling some of her fertile soil **—land similar to that** which during many years **has averaged 20 to 45 bushels of wheat to the acre.** Think of the **money you can make** with wheat around **$2 a bushel** and land so easy to get. Wonderful yields also of **Oats, Barley and Flax. Mixed farming** in Western Canada is as **profitable an industry as grain growing.**

The Government this year is asking farmers to put increased acreage into grain. Military service is not compulsory in Canada but there is a great demand for farm labor to replace the many young men who have volunteered for service. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

MY TREASURE

I sold my conscience to the world;
The price I thought was good.
My conscience—'twas a useless thing;
I needed clothes and food.

But when 'twas gone my joy went, too,
And peace had flown away.
The things the world gave in its place
Were broken in a day.

And then the way grew steep and dark,
My feet began to slide,
I did not know which way to go,
For I had lost my guide.

I bought my conscience back again—
My conscience worn and old!
The world demanded thrice the price.
Since I to him had sold.

Just all I had I paid for it,
And took the poor thing back,
And turned me to my empty home,
Yet did not feel the lack.

It nestled in my heart again,
And held my life as true,
And showed me right and wrong as clear
As if it had been new.

I have my conscience back again,
The world may keep its gold,
For peace and joy have flown back, too,
And never shall be sold! — Ellen Wilson.

THE HONOR OF THE HOUSE

By Harriet Prescott Spofford in Youth's Companion

BEFORE the low fire sat Allan McGregor, with an envelope in his hand, from which he had lately withdrawn a document.

His forebears had been wealthy folk, but he himself had only what was left of their splendor—some old furniture and pictures and the ancient house to which he returned from the city every night by trolley. He was a broker, in not too large a way; and when his income warranted, he would marry Hester, who wore his betrothal ring—a much more expensive ring than he had the moral right, perhaps, to give. But then, it would be an heirloom.

Allan McGregor knew that he was an honest man; it was impossible for a McGregor to be otherwise. That was a matter of family belief.

If the McGregors had ever married into families less strict than themselves, the force of the McGregor strain had overcome anything less worthy. So the document in Allan's hand should have been not in the least attractive.

Yet another man might call it, in a way, inviting. It offered him an opportunity to divide a million dollars with the writer. But the transaction was shady, and although it offered the two principals perhaps a fortune, it involved possibilities, if not probabilities of loss to others.

Allan read the paper again. Yes, it was certainly inviting. There was barely one chance in a thousand of harm to others, he argued. Dividing a million dollars with one other man meant that soon he would be a very rich man himself. And with but the half of a million dollars he could restore the old place; he would be marrying Hester while yet her beauty was resplendent; they would have travel, art, luxury, and all the enjoyment of life. For a little while he sat picturing to himself the way he might live with Hester on that great sum of money. Yes, yes, it was a wonderful scheme; it was tempting—at least, it would have been tempting to any one but a McGregor.

And yet not every drop in Allan's veins was McGregor blood. There was the gay lady, his great grandmother, whose portrait hung in the high panel above the mantel now. She was a Fairweather, and the Fairweathers were easy going people. Great grand-mother herself had loved the pomps and vanities, had bewailed her loss of them, and had effected a loan through which the family fortunes were restored by pretending an interest in an old lover. Great-grand-father had never quite understood that business; he was too upright and downright for that. But great-grandmother was a complex character, and congratulated herself on getting something for nothing. Plainly, if Allan McGregor found this proposition which he had been asked to consider, too tempting, it would be the fault of his great-grandmother.

He looked up at the portrait, its gleams evanescent in the firelight—the lovely, laughing lady in her paduasoy and pearls, with her fan of white peacock feathers. Her eyes, that had the sparkle of black diamonds, seemed to glow and darken in the flickering light, and her smile was like a thing alive. That portrait was painted when she was in her glorious prime, and the changing play of the flame brought all her sweet archness and gaiety into being again. So joyously in love with life did she seem that it had always been a pleasure to him to look at this portrait. Here was something that declared what the family had been.

As he glanced up, in a new outburst of the fire on the hearth, the lady seemed to be moving toward him, smiling upon him with a thousand meanings, as if—it all at once occurred to him—she had something to say about the document in his hand. What would she say to it?

He knew very well what she would say! For how had she conducted herself in the great trial of the family fortunes which had occurred a hundred years ago, during those sad days of the embargo in the second war with England?

On a great adventure overseas had the fortunes of the McGregors been embarked. All their resources except what, in case of disaster, would afford a bare livelihood, were engaged in the fleet of ships led by Capt. Roderick McGregor of the Albatross, the son of this lovely lady, and of her husband, old Allan McGregor. The adventure had not been to the far East, but to a British port of the West Indies, and Captain Roderick had taken out clearance papers before knowing of the embargo which confiscated all ships hailing from a British port. He had been delayed by opposing winds. Many and many a ship's master, learning the news of the embargo from passing craft, had put into a neutral port of the French or Danish West Indies, and had taken out false papers, sailed home, and saved ship and cargo. What Captain Roderick would do was a problem with which all the people of the little home port concerned themselves.

He was a young man with a wife and children who needed all he could make. Would he enter a neutral port and clear from there? It was surely stretching a point to say he had no right to do so. Or would he stand by his colors and hail from the port where he had taken cargo? There was hardly a dissenting opinion among the people—only enough to make assertion lively. Those who had known Roderick McGregor before he ever trod a deck believed in his inflexible honesty, and felt he would trust in the good faith and comprehension of the government when it should be shown that the vessels had cleared before knowledge of the embargo.

In the McGregor mansion there was much anxiety. It was high time the Albatross and her fleet came in. Old Sandy, the serving man, had been up on the roof with his spy-glass for hours each day for a week or more.

The lovely lady had a way, in any stress of bad weather or ill fortune, of arraying herself in gay colors and ribbons and her best paste buckles, in order that, if everything else was sad, some brightness should be present. She sat now opposite her husband, her little foot in its high-heeled slipper tapping the floor impatiently. She was dressed for dining in splendid state if Captain Roderick should make port that day. Sandy had gone down for his afternoon gossip on the wharves.

"You are gay," her husband said, as she spread out her gown—it might have been this very peach-bloom and silver gown of the portrait.

"And why not?" she answered him, beaming upon him as he sat bound to his chair with his troublesome gout.

"Why not, indeed?" he answered, half sadly. "But our old ways will ill consort with the new conditions, where we shall have to make one dollar do the work of $50."

"Oh, no!" she said, lightly. "Want is never to be our master, Mr. McGregor."

"You would say—"

"I would say that my son Roderick is no man's fool. He is not sacrific-

The Cultivator Patterns

8229—Ladies' Clothespin Apron. Cut in one size. The apron is cut in one piece and slips on over the head.

8258—Girls' Dress. Cut in sizes 6 to 14 years. The dress closes at the back and has a skirt with a one-piece gathered flounce.

Los Angeles

ing his advantage, our advantage, for any air-drawn scruples!"

"Madam, I know not what you mean!" exclaimed the indignant husband.

"I mean, as I have said before, that our affairs are entirely safe. Roderick is not my son for nothing."

"I fail to understand—"

"Oh no, you don't, my dear, not at all. You understand perfectly. Roderick is of such sturdy common sense that we are not only safe, but sure of profit. Roderick will have gone into St. Thomas, Cuarcao, Basse Terre—any port that has escaped the British lion's paw, and will have cleared from there."

"You forget, madam, that that means the taking of a false oath with his clearance papers."

"It does? The recording angel will blot it out. It is for his home, his family, his house. He will not betray them. I have no fear of Roderick. He is my son." And she fanned herself slowly, shedding about her the fragrance of the Tonga beans among which her fans reposed.

"And my honor?"

"A fig for your honor!"

"Madam,"—her husband shook his stick in the air,—"Roderick may be your son; but he is my son, too. He is my son, too. I tell you! I, also—I—gave him life. It is my blood as well as yours that flows in his veins. He bears my name. My honor is in his keeping. My son will not be false to my blood. He will not disgrace my name. He will not betray my honor. He will never be false to the honor of the McGregors!"

She made no reply, but sitting back in her chair, swung her fan in leisurely fashion.

It was at this moment that Sandy, forgetting his respectful usages, ran up the steps and through the hall, and stood breathless in the doorway of the drawing room—this very room where Allan McGregor, the younger, now sat over the fire, and where the lady's portrait hung. "The ship Albatross, Captain McGregor, is in the offing," he cried, "waiting for wind and tide! She flies the British flag with ours, and hails from Barbados!" His tone was full of joy.

There was a moment of dead silence, on the lady's part perhaps of consternation. And then the tears fell, and she ran and hid her face in her husband's breast. "I am glad, I am glad!" she cried. "I thank God that he is your son!"

Allan McGregor, as he recalled this legend of the family, a hundred years old now, was looking up at the portrait. For an instant the lovely lady, in the flicker of the blaze, seemed to bend over him with tender questioning, and to smile with eyes that saw no one but him.

Mechanically, as he gazed, he slipped the document he held back into its envelope, and stooping to the coals, he stirred them to a blaze, took out his fountain pen and redirected the big envelope to its sender. "Neither will I betray the honor of the McGregors!" he said.

SARAH BERNHARDT'S TEN COMMANDMENTS

1. Have one chief, absorbing interest in life.

2. Have other interests, little interests, of life to keep you from becoming one-sided.

3. Decide what are the essentials of your life and concentrate upon them.

4. Be interested in everything that happens for the moment, but do not let the interest become too deep.

5. Eat what you like when you like, but not as much as you like.

6. Do not let the material profane the spiritual.

7. Drink much water and lemonade.

8. Sleep whenever and wherever you are sleepy.

9. Stop to rest for a minute, many times a day. These little rests prolong life.

10. Find your work, then regard that work as a pleasure, not a penalty.

DAILY THOUGHT

Whether you be man or woman you will never do anything in the world without courage. It is the greatest quality of the mind next to honor.—James Lane Allen.

Embedding for Callusing

Fig cuttings and grape cuttings are cut at uniform lengths and tied in bundles, then instead of placing in nursery row at once they are "callused" by being placed in trenches, tip end down, and covered with say four or five inches of fine soil. This layer of soil is soon warmed by the sun which, with the proper amount of moisture, puts the upper end—which is to be the lower end of the cutting when placed in nursery row—in a condition to callus ready for rooting. A few weeks later they are removed from this trench, the bundles broken and the individual cuttings placed in nursery row. From these calluses soon spring young rootlets, making in one year a tree ready for orchard planting.

PRODUCING MILLIONS

Continued from Page 343

Nursery legislation is now getting into a position which means a reasonably satisfactory solution for all, but we doubt not the question will always remain to a degree. The nurseryman, that is, the average nurseryman, is willing and even anxious to have proper legislation. In fact, one suggested enactment for the present legislature made by our best nurserymen is that all nurseries shall be registered with the state horticultural commission and that a certain regisraion fee shall be paid. This is favored for several reasons, among which we may mention this, that one of the objectionable practices of California "backyard farmers" is the production of a few nursery trees of a variety which happens to be in demand. These small supplies of nursery stock, practically unknown to the trade, yet are sometimes so generally planted that their coming on the market at the last moment often completely upsets and destroys the market for those particular trees. The nursery business is important enough and involves risks sufficient that the nurserymen feel that they are entitled to the protection which comes from placing their business on a legitimate basis.

But more specifically about the nursery business in Fresno, which is the center for thousands of acres of nurseries, there are three large nurseries; that of the Fancher Creek Company, the Fresno Nursery Company, and the Kirkman Nurseries, and while Fresno is the center from which the business of these great nurseries is directed, not only many acres of Fresno County are devoted to raising stock, but also many acres in Tulare, Merced, Madera, Sacramento and even one or two counties in Southern California.

The story of these nurseries we are telling this week more largely through photographs than through the written word, but the methods of handling this great industry are certainly most interesting.

Many trees, and even shrubs, require two to four years to prepare for the planter. In the case of deciduous fruit trees two years is the usual nursery life of the tree. The pit or the seed is planted either in the fall or the following spring; the budding is done the next fall or possibly grafting in the spring; then one year of almost continual care is given to the growing bud; often it is even tied to a stake and its growth watched inch by inch.

After the dormant period of the next fall the great nursery plows are put into the rows and the trees are "lifted" and taken to the packing ground where they are heeled in to be drawn upon when needed. The citrus tree spends one year in seed bed, one summer in nursery row as seedling, another or possibly two years after budding.

As the orders are made up deciduous trees are tied in great bundles with tules and moss for packing and protection. The packing in bundles is sometimes done with an ordinary windlass and rope, drawing the bale or bundle into the smallest compass. It is then tied with heavy cords and the package trimmed and made to look as neat as a bandbox, and these great bundles are then shipped to all parts of California and even to all parts of the United States. The larger nursery may be supplied with a power windlass which enables much more rapid baling.

The harvesting of the tules for packing calls for the work of hundreds of men in the marshy lands of the rivers of the San Joaquin Valley. They are hauled in the fall and stacked in bunches of hundreds of tons.

FEDERAL FARM LOAN OFFICERS

The federal farm loan board has announced the following appointments of officers and directors of the federal land bank of Berkeley, California: President and director, Burrell G. White, San Francisco; vice president and director, R. L. Douglass, Fallon, Nevada; secretary and director, S. A. Reed, Los Angeles; treasurer and director, Dr. George W. Thomas, Logan, Utah; director, Dr. Elwood Mead, Berkeley; registrar and attorney, Lysander Cassidy, Phoenix, Arizona.

Lifting and Bundling the Trees

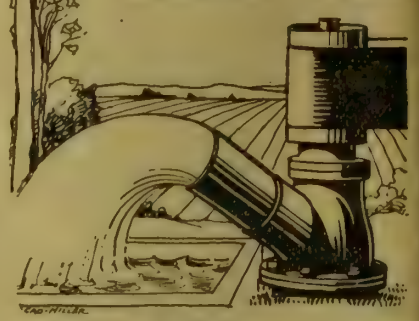
Gang of workmen in Kirkman Nurseries pulling out, bundling and labeling trees. From these nursery rows the trees are transferred to the shipping yard where they are heeled in and used for filling orders, at which time they are tied in great bundles. The appearance in the yards is shown in the cover illustration, which gives a small section of Mr. Roeding's nursery in Fresno.

LAYNE & BOWLER PUMPS

It is surprising how few owners of pumping plants realize the enormous saving that an efficient pumping plant will make. The sinking of a well is the first cost, but the pumping cost is continual; therefore the question of selecting the right pump should be duly considered beforehand. Our Engineering Department is at your service to assist you in permanently solving your pumping problems. Write for free Catalog No. 30.

Layne & Bowler Corporation

900 Santa Fe Ave. Los Angeles



IRRIGATION Preparedness

Wouldn't it be a rather good plan after a prosperous year to replace your old uneconomical plant with a newer and better one? Let us furnish it. Or perhaps all your engine or pump needs is a good overhauling. Let us do that and we will do it right too.

Citrus Fruit Market

LOS ANGELES, March 21, 1917.

Owing to storms of a couple of weeks ago holding up shipments at that time, also to railroads refusing to accept perishable freight during last week when a possible strike was pending the market is practically bare and extremely high prices have been prevailing. Many better grade navels have sold around $4.00. The lemon market also is exceptionally strong.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 12,546 cars, lemons 2317, total 14,863; to same date last season, oranges 10,415, lemons 2080, total 12,495. From Central California to date this season, oranges 4046, lemons 163, total 4209; to same date last season, oranges 4199, lemons 143, total 4342. From Northern California to date this season, oranges 843 cars, last season 610 cars oranges and one lemon.

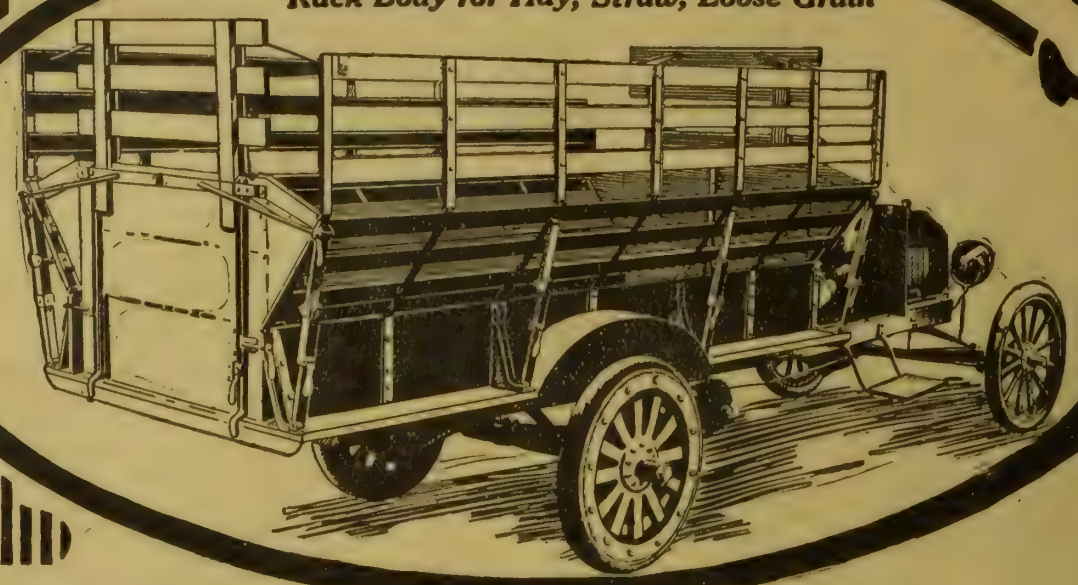
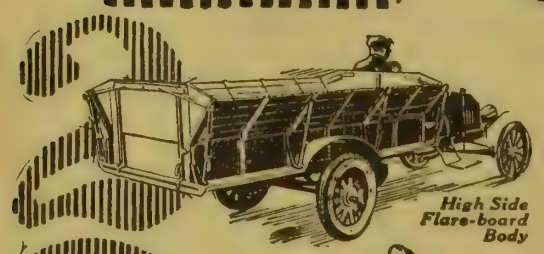
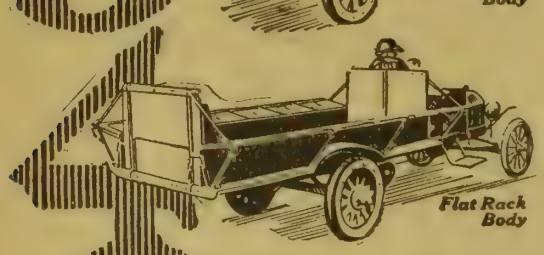
Rack Body for Hay, Straw, Loose Grain





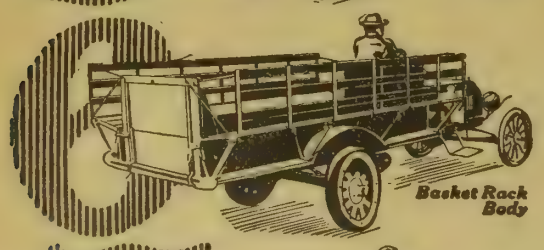
High Side Flare-board Body

Hog Rack Body

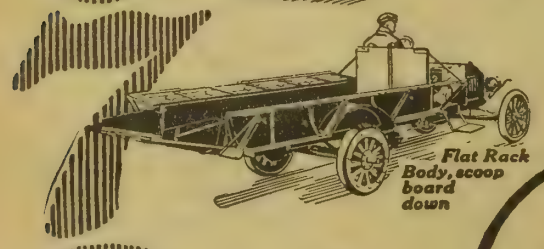


Flat Rack Body

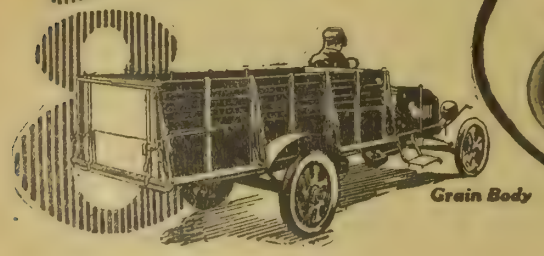
Stock Rack Body



Basket Rack Body



Flat Rack Body, scoop board down



Grain Body

4 Times the Work at Same Cost

In all heavy farm hauling this is what users of Smith Form-a-Truck are doing. Hauling twice the load three times as far—saving feed charges, veterinary bills and farm labor — and doing its work in all kinds of weather at the lowest cost for hauling that has ever been reached.

Keep Horses for Farm Work Only

Use your horses for plowing, seeding and harvesting. But not for hauling. You delay farm work—lose time and money.

Let Smith Form-a-Truck carry your manure — hay — fertilizer and do all other hauling on the farm. It will do the work of four teams. *And at half the cost!*

Use the Smith Form-a-Truck for hauling milk, grain and other farm products to town. It will haul as much as two teams. *And in half the time!* That alone will save two to three hours' time for two drivers. In a year it amounts to 1200 hours—120 days—$240 pay. And it gives you the use of those four horses for farm work.

20 More Acres

Your Smith Form-a-Truck is as good as 20 acres of land to you. Government figures show that in a single year four horses eat all the feed that can be grown on 20 acres of land. Smith Form-a-Truck will save that. 20 acres of land for $350! Think of it!

Unbeatable for Dairy Farm

All over the country dairy farmers are replacing expensive horses with economical Smith Form-a-Trucks. It will haul 2,000 pounds of milk ten miles and return with the empty cans in less than 2 hours. And the total cost for the round trip is but $1.50 — gasoline, oil, tires and everything. Think of it! Two teams and two drivers would require a half a day for this work.

And in every other line of farm hauling Smith Form-a-Truck is showing equal economy.

Travels Anywhere

Smith Form-a-Truck will travel anywhere horses will go—through mud, sand, snow. No hill is too steep.

Famous 8-in-1 Convertible Farm Body

Change to any one of eight types of bodies is made instantly with the famous 8-in-1 farm body. No tools required. Merely pull the lever. This is an exclusive Smith Form-a-Truck feature.

Amazing Strength Smith Form-a-Truck combines with any Ford, Maxwell, Overland, Dodge Brothers, Buick or Chevrolet to make a fully guaranteed one ton truck. When the chassis of these cars is telescoped on the Smith Form-a-Truck frame, the wonderful strength of these cars is reinforced. A double construction feature is provided — the strongest construction known to engineering.

And the rear axles of these cars merely become jackshafts for the chain drive. The strong, sturdy Smith Form-a-Truck axle carries 90% of the load.

Unequalled Economy Note these wonderful records of Smith Form-a-Trucks in daily use on hundreds and hundreds of farms. 12 to 15 miles on a gallon of gasoline—6,000 to 8,000 miles on a set of tires — 12 to 18 miles per hour. The first Smith Form-a-Truck ever built is still in daily service. It has traveled over 20,000 miles. And total repair cost has been less than $8.00.

Send Coupon Now Every day's delay in putting the Smith Form-a-Truck on your farm costs you hard earned money. Send for the big FREE Book *today*.

Write your name on the coupon *Now*. Never mind pen and ink. A pencil will do. But mail it at once.

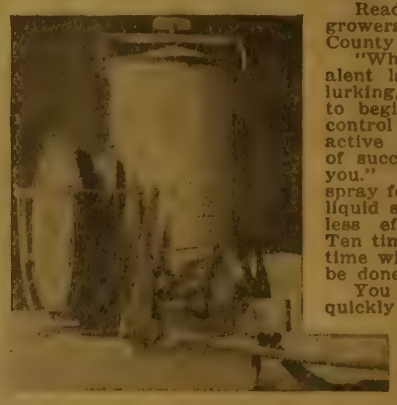
Mr. GRAPE-GROWER

It is almost time for MILDEW.

Remember:—"A Puff in Time Saves the Vine."



Read this extract from a letter to grape growers of Tulare County by C. F. COLLINS, County Commissioner.

"Wherever this disease (Mildew), was prevalent last season, millions of spores are now lurking, waiting proper atmospheric conditions to begin their work of destruction, and their control is very difficult after they have begun active operations upon the vines. The secret of success lies in "doing them before they do you." The best authorities agree that winter spray for mildew is practically useless, and that liquid spray at any time is more expensive and less efficient than DRY SULPHUR. • • • Ten times as much can be accomplished at this time with one half the expense, as can possibly be done one month later."

You know how necessary it is to do the work quickly when the right day comes. READ THIS extract from a letter from S. C. DAILEY, a grape grower of Kingsburg, Cal., concerning

The American Beauty Sulphur Machine

"I used one of your American Beauty Machines in my Emperor vineyard last season with perfect success. Emperors are especially hard to keep free from mildew, as you have to irrigate them so much to produce good fruit. This over-irrigation makes the mildew grow, if it has the least chance. The year before I used more sulphur with a foreign machine, and there were lots of grapes damaged. I attribute my success last season to the fineness and volume of the cloud of sulphur thrown by the American Beauty Sprayer. After using it there was not a trace of mildew in my vineyard. Your machine works twice as fast as my old one."

DON'T LOSE VALUABLE TIME tinkering with a poor machine. A few hours lost at a critical time may cost you your crop. Send us $11.00 for a vineyard size, or $13.50 for an orchard size machine, and we will send you an American Beauty Dust Sprayer, all charges paid. Try it. If it is not entirely satisfactory, return it at our expense, and we will cheerfully refund your money.

WE FULLY GUARANTEE EVERY MACHINE

Vol. XLVIII No. 13 LOS ANGELES: March 31, 1917 One Dollar Yearly

Deciduous Fruit Prospects

The Season is Backward. Cold Weather May Have Done a Little Injury. General Predictions Favorable for Good Crop. Too Early for More than Good Guesses as to Harvest

Many More Reports in Hand for Next Week

IT is too early to predict with much definiteness this year's deciduous orchard crops, for it may be recalled that on the 7th day of May of 1916 a frost, unprecedented, but none the less most destructive, visited many fruit growing sections of California. Here's hoping such a visitation may never occur again, but we mention this at the outset of our 1917 crop reports to show one of the factors which have to be considered in determining the coming output. We also mention it to be entirely fair with many of our subscribers and correspondents who have given of their best judgment, and for them we ask consideration of the fact that they are giving these early estimates, fully realizing the uncertainty of weather and other conditions which may cause them to entirely change these estimates later. We recall that last year one apricot grower estimated the output of his county at not far from 75 per cent of normal. Later he wrote, recalling this estimate—because of the late frost—changing it to 25 per cent. This season also is fully two weeks later than usual, which increases difficulty of making an early estimate.

Notwithstanding this uncertainty these crop estimates are of value and may aid many a grower in considering present day marketing conditions. Above all, we hope this lesson will be taken by every producer: "Sit tight; do not sell unless the offers are entirely satisfactory." It now appears that this is the grower's season, and, if he will, he may command fair treatment. Reports are still coming in, and this week's estimates are only a forerunner of those which are to come the next and following weeks.

We appeal to every subscriber to give of conditions as they appear in his section. As a help in forming an opinion of the total output in the state we quote on this page from Deputy Commissioner Weldon's table showing percentage of the state's output of fruits grown in each of the main producing counties during a season of normal production. Counties which produce less than two per cent of the state's total of a special crop are indicated by stars or blanks.

The Cultivator appreciates the help of its correspondents. Their reports follow:

Roy K. Bishop, Horticultural Commissioner, Orange County

I have made a thorough canvass of the deciduous fruit prospects in this county and find that the outlook is most excellent.

From present indications the apricot crop will be one of the largest that we ever had. The trees are so thick with young fruit that it will need thinning. This is also true of peaches. The frosts of the 9th, 10th and 11th of the month were not severe enough to injure the blossoms.

The walnuts are just coming out, but the conditions now indicate a very fine setting of nuts.

I estimate apricots at 100 per cent plus; peaches and walnuts at 100 per cent.

J. P. Dargitz, Sacramento, Sacramento County.

When the warm pleasant spring days come and the trees are heavy with bloom and the sap starts to flow in the fruit trees, then hope eternal begins likewise to flow in the veins and imaginations of the orchardist and cultivator.

The speculator in farm products likewise looks out over the landscape and sees in the oceans of bloom promise of new worlds for him to conquer, or at least to cinch. First he thinks of a wonderful crop and low prices. Then he talks it and tries to make every farmer and fruit grower see it his way.

The farmer and fruit grower, naturally hopeful at this time of the year, sees all about him such promise of big crops that he is an easy victim. Then comes the awakening after he has sold his crop based on enormous yields, and he finds that the yield is only ordinary after all.

If the heavy frosts we have had the first half of March do not mean short almond crops and apricots ditto, then we need never think of spending big sums of money and hard work for smudging.

If any man can at this time tell that no evil will befall cherries, peaches and prunes before harvest time, his fortune is made and he need no longer mow thistles nor dig Johnson grass.

ESTIMATED PER CENT OF THE TOTAL CROP of the PRINCIPAL CALIFORNIA FRUITS GROWN IN EACH OF THE MAIN PRODUCING COUNTIES DURING A SEASON OF NORMAL PRODUCTION

*Less than 2 per cent of state's normal crop grown in county.

Joseph H. Bone, Secretary, California Prune and Apricot Growers.

It is entirely too early for us to estimate any damage. It has been reported that apricots had suffered quite a bit, which we are inclined to believe has been very much exaggerated.

Almonds have set very well and do not seem to have suffered any damage.

Cherries too early to predict; this is also the case with peaches and prunes. The latter are not yet in bloom.

The Saratoga blossom festival has been postponed on account of the lateness of the bloom.

To predict the size of the crop of any one of these fruits would not be safe because there is nothing to base crop prospects upon.

G. H. Waters, Citrus Fruit Juice Company, Romona, Los Angeles Co.

I have just driven over the fruit district and made a very careful examination, more especially of the apricots, but I have also examined the peaches so think I can report intelligently.

The first bloom of the apricots was mostly killed, but there were a great plenty of buds that had not yet come out, to still make a good crop. I think we will have 75 to 85 per cent of an apricot crop in the territory I visited, which is the principal peach and apricot district of this locality.

Peaches are in full bloom, and on very careful examination in a great many orchards, I find the damage very light. I would reckon the present outlook at 100 per cent of a peach crop. In the 25 years I have operated in this valley, I have seen but one damaging frost after this time of year, so I feel we are reasonably safe for a normal crop, though it is somewhat backward, probably two or three weeks later than last year.

Chas. F. Collins, Horticultural Commissioner, Tulare County.

I belong to the class who doubt the advisability of estimating fruit crops at this season of the year as I believe harm frequently results from reports of this kind so early in the season. Of course, if everyone fully realized that all we can do is to judge the future from the general conditions of the present, no harm would result, but so many people seem to think, if optimistic reports are given out regarding blooming and general conditions at this season that it means an unprecedented crop.

Cherries are not grown here, almonds to a very limited extent and but very few apricots. I took a run over into Kings County, where they grow large quantities of 'cots, and found that a very large number of the young 'cots, especially on the lower half of the trees, are killed by the frost. As the trees, however, are loaded with five times as much bloom as is necessary, there may still be a good crop of 'cots. I have examined many peaches but to date have found none that are injured, as they were fully protected by the bloom. Prunes are full of buds and, of course, are not injured as they are not yet in bloom.

We have had more frosty nights here than I have ever seen before in a residence of 30 years, and they have continued quite regularly for some time past until two or three nights ago. We have had plenty of moisture and the soil is in good condition and farmers are taking advantage of this and hurrying up their spring work.

[As we go to press Mr. Collins writes that his estimate is now ancient history as a frost has come and worked havoc in many sections. His later estimate next week.—Ed.]

Wm. Jas. Hill, California Cured Fruit Exchange.

I much regret that in the present state of this Exchange I am unable to give you the desired information from a state-wide point of view. I hear from my own county, Shasta, that the many severe frosts have practically destroyed the almonds, apricots, and early blooming peaches, but as their season is later than most fruit-bearing districts it is too early to give an opinion on the crop outlook for prunes and Muir peaches.

You are, of course, aware that Shasta's crop, though very material to us, does not seriously affect the state supply.

C. A. Baker, Piru, Ventura County

The frost of March 9th and 10th got everything out of the bloom. Apricots will be 50 per cent of normal crop.

J. C. Metzger, Secretary, Chamber of Commerce, Santa Ana, Orange County.

It's a bit early to judge, but 'cots now are fine, promising 100 per cent. Almonds, cherries, peaches and prunes are not grown in this county in commercial quantities.

Fred Seulberger, Horticultural Commissioner, Alameda County

It will be about two weeks before I can give estimate, as the fruit has not set on the trees yet.

A. L. Shively, Santa Paula, Ventura County.

A 40 per cent apricot crop is estimated for this county.

Harry Ladd, Stockton, San Joaquin County.

It is too early to forecast conditions on all our fruit crops except almonds and apricots; other fruits not far enough along with the bloom to give any reliable data. We had a very cold morning this morning (March 22) with plenty of wind, and I think that there has been no damage done, however, if we get a quiet morning as cold as this we will lose severely.

I think that apricots in this county have suffered to the extent of 15 per cent with frost, and almonds not more than 5 per cent.

If there is a heavy damage in the next few days I will report it to you; otherwise you can get a report from the state board soon after the first of April.

A. E. Beers, Horticultural Commissioner, Merced County.

There has been slight frost injury to apricots, but this county has only small bearing acreage.

Almonds show no injury.

The heavy bloom on the peaches was uninjured by frost; there will be a 100 per cent crop.

There are no cherries raised in this county, except in family orchards; also no commercial orchards of prunes.

Tomato plants have been held back by cold nights. Grain acreage large but backward because of cold, dry weather. Growing finely now.

Geo. D. Kellogg, Newcastle, Placer County.

There are very few apricots grown, but crop is good.

Not many almonds grown.

Prospects for cherries are good.

Peaches, prunes, plums not hurt on high ground, but frost killed some on the low land.

A. Hancock, E. Bakersfield, Kern County.

50 per cent apricots and possibly less.

Almonds about the same as apricots.

No acreage bearing cherries.

Peaches probably about 60 per cent.

Prunes, good chance for a full crop.

Weather conditions have been very much against a good fruit crop this year in Kern County, and the prospects at present are not very bright. The cold snap the second week in March hurt the apricot and almond crop a good deal except in a few favored locations. The peach crop is damaged considerably, but not so much as the apricots or almonds, as they were not so far advanced.

The prunes, I believe, are not hurt so far, but as they are just starting to bloom and as it is now blowing and raining there is no knowing what will happen a year such as this has been so far.

MORSE'S SEEDS FOR FARM AND RANCH

Plant Morse's

Alfalfa, Clover, Beans, Peas, Grass, Tomatoes, Onion, Corn, Mangold, and all farm, field and vegetable seeds.

C. C. MORSE & CO.
SEEDSMEN
733 Front Street San Francisco

It is entirely too early to give any definite figures yet as it is not possible to tell exactly how much damage the frost has done because sometimes it takes quite a little while to develop. A report about the middle of April would be a good deal more authentic and reliable.

But it is certain that the crops have been damaged and I should estimate it to be as I have stated above.

A. A. Brock, Horticultural Commissioner, Ventura County.

The production of the prune and almond in this county is confined to about two districts. The cherry and peach crop is also of minor importance. The apricot crop is grown on approximately six thousand acres, 2500 of which are in bearing.

We feel that the loss from the recent cold weather will amount to from 30 to 40 per cent over the entire county.

C. M. Conner, Farm Adviser, Kern County.

Apricots, 85 per cent; almonds, 100 per cent, peaches, 100 per cent, and prunes, 90 per cent.

Thomas P. Redmayne, Horticultural Commissioner, Marin County.

Owing to the backwardness of the season due to the continued cold weather it is too early to make any definite forecast of the crop. A single frost might upset all calculations. The fruits mentioned bloomed well above the average.

Cherries are just coming into bloom but are well set with fruit buds.

Almonds are apparently setting 100 per cent fruit.

Apricots indicate at present above normal.

Olive Trees

such as these are grown only on our foot-hill locations — Note the good roots — for hardiness they have no equal.

We have a fine block of Mission and Manzanillo trees—both on PICHOLINE roots and grown from cuttings. We have had splendid success on all olive plantings--a most important assurance to you.

Teague Quality Citrus Trees

will all your citrus wants appease

MARCH is an ideal month in which to plant orange and lemon, pomelo and lime trees. The advent of warm weather as the rainy season draws to a close, renders the soil ideal for tree growth. Ideal conditions call for ideal trees, which are the only kind we have to offer, hence are anxious to serve you. Correspondence a pleasure; a telephone message a joy; and a personal interview a delight.

R. M. Teague
Citrus Nurseries
R. M. TEAGUE, Manager
San Dimas, California

Peaches and prunes not yet set.

Though there has been much fros the moist condition has prevented an apparent damage. The critical tim is the next two or three weeks.

Geo. C. Nevins, Hemet, Riverside County.

As to fruit prospects here, I can only say, just now, that it is merely guess. Growers are estimating fron 25 to 75 per cent of a full crop of apri cots. Some orchards, particularly i the higher portions of the valley, no show a full crop of healthy looking very small 'cots, but how much of thi will mature is a question, while othe orchards show scarcely any setting.

Two years ago, with a large crop we had approximately 7500 tons fres fruit, and with the young trees now coming into bearing a normal yiel would be net less than 10,000 tons 50 per cent of which would yield u a crop of 5,000 tons, with which t meet any German invasion; but it wil require some weeks yet to determin the extent of our preparedness in th way of apricots.

Peaches are in full bloom and very promising, notwithstanding there wa a freezing temperature this morning and growers are expecting satisfactory returns, and I am passing along you suggestion to sit tight.

We do not grow almonds, cherries or prunes in a commercial way.

* * *

Since my report to you, March 23 we have had a freeze that has destroy ed nearly all of the setting of Royal apricots.

The Tiltons, which are two or three weeks later than the Royals, and some orchards of Royals which were late in blooming, were in full blossom at the time of this freeze, and probably were not injured. So the indications now are that 25 per cent of a crop of 'cots is a liberal estimate.

Samuel Fox, Corning Cured Fruit Association, Tehama County.

Apricots, 10 per cent of crop only; almonds, 75 per cent of crop; peaches 75 per cent of crop; prunes blooming heavily, but cannot tell how they will set yet. Weather cool but no frost, which is good for all fruits.

John J. Fox, Horticultural Commissioner, Napa County.

It is as yet too early to offer anything definite, but you may report for my county that: Prunes are two weeks later in blooming in Napa County than last year. In 1916 French prunes were in full bloom from March 14 to 16, and were injured by frost on the 22nd. This year they will probably be in full bloom about the 28th. There is a heavy set of buds in splendid condition on all fruits. Cover crops with a few notable exceptions are very poor. Plowing is more than half through and the ground has never turned up mellower or worked down more kindly.

Failing adverse weather this should be a good year for pears, prunes, peaches and cherries. Apricots and almonds have suffered considerably.

Our little county has already planted out over 2000 acres of trees during the past season, which has been a splendid one for work of which growers have availed themselves to the full. The result is a satisfied feeling in the community that can be felt.

W. H. Heileman, Farm Adviser, Glenn County.

Apricots, in my best judgment, will give 25 per cent crop; almonds, 80 per cent; cherries, 95 per cent; peaches, 80 per cent and prunes 95 per cent.

Red Bluff Cured Fruit Association, Tehama County.

Apricots will give about a half crop, have been damaged by rain and frost.

Almonds will give three-fourths crop.

As to cherries it is hard to tell; indications are for a fair crop.

Peaches look like full crop.

Prunes are budding well; indications good.

It is too early to make predictions as frost danger is not over until May. Most killing frosts occur in April here.

Sheridan W. Baker, Santa Rosa Cured Fruit Association, Sonoma County

Apricots and almonds are not grown commercially. Would estimate both

Plant Germain's *Proven* Seeds

Why pay a large part of your income for food—when a home garden will produce nearly all you need at but trifling cost and a little healthful work?

Home gardens are the *real things* this year. Prepare your soil right now and plant Germain's proven seeds—and you'll get big results.

Defeat high cost of living with Germain's Proven Seeds.

I. B. Matthews, 485 Jackson St., Pasadena

at 50 per cent. It is too early to make any estimate on cherries, peaches or prunes.

O. S. Hofman, San Jacinto, Riverside County

Apricots, about 50 per cent; good prospects for peaches.

J. F. Benton, Horticultural Commissioner, Humboldt County

It looks as if the crop of apricots, cherries and peaches would be good; almonds, not good.

Conditions backward; at least three weeks late owing to late cold storms in foothills and coast sections with snow in high elevations.

C. K. Turner, Horticultural Commissioner Placer County.

Regarding prospects for the coming fruit crop, will say that it is, as you suggest, entirely too early to give close estimates. In fact any estimate at present would be the rankest kind of a guess. The long spell of cold weather which has continued, so far, through the blossoming season, together with cold rains and north winds at intervals, may have had a more weakening effect upon buds and blossoms than is at present evident, and may be the cause of a heavy drop later on.

So far the frost damage seems to be confined to the earlier blossoming varieties of plums; with them the crop is undoubtedly thinned, but to what extent it is impossible to say at this writing.

On the other hand, practically all our trees are making a splendid showing of blossoms, and for the sake of economy it would probably be better if the weather does do some of the necessary thinning. This refers to plums, peaches, almonds and 'cots; our pears and cherries are only now beginning to blossom, but there is sufficient evidence to show that they also will blossom heavily.

To sum it all up, we are all at sea at present. As one of our prominent growers and shippers expressed it in conversation with me yesterday, it would not surprise us if there were a bumper crop: but on the other hand neither would it be a surprise were the crop very materially shortened. We should be able to form a fair estimate of the crop in a couple of weeks provided that the weather conditions are favorable from now on.

O. E. Bremner, Horticultural Commissioner, Sonoma County

There is no question but that California wants a fruit crop this year, but anyone who would predict now as to the conditions at market time certainly must have some kind of inside information that I do not possess. The principal crops are not yet in bloom; such as prunes, apples, pears and grapes. A thousand and one things may happen next month, which may totally or partially destroy the crop.

At the present writing, the only thing we can say is there is a fine bud set, the trees look well and if no adverse weather conditions occur we ought to have normal crops all around. I doubt if there has been enough frost up to the present writing to do any material damage to this section.

Winters Dried Fruit Company, Winters, Yolo County

Apricots, 75 per cent; almonds, Hatch varieties 60 per cent; others 100 per cent; peaches and prunes, blooming, good prospect.

Crop report will be given out by this office April 1.

H. J. Baade, Farm Adviser, Napa County

To date we find the following to be the approximates on the crop yields of the various fruits: Apricots, 10 per cent; almonds, 95 per cent; cherries, peaches, prunes, pears, full crops.

The weather has been rather cold in this district this spring, and the fruit has been somewhat retarded. If we do not have more frost most of the crops will be above normal, with the exception of the apricots as above stated, which were badly frosted.

S. V. Christierson, Horticultural Commissioner, San Luis Obispo County

Apricots, 60 per cent, frost and rain damaged. Almonds, 75 per cent, hurt by frost. Cherries not grown commercially. Peaches, 90 per cent; prunes, 95 per cent.

The Supreme Tractor for Cultivating

The Bean TrackPULL SIX HORSE Tractor is the Ideal Machine for Cultivating

Cultivating time is here and every farmer and grower should know about the many advantages of using a Bean TrackPULL Tractor.

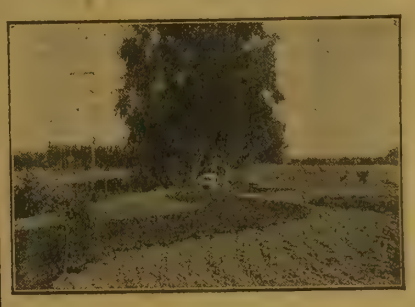
The Bean TrackPULL is very light, weighing only 2875 pounds. It pulls itself over soft soil and does not sink in nor does it pack the soil.

How it Works

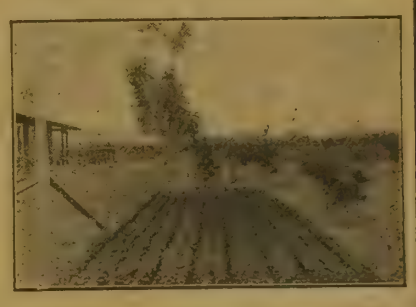
The Bean TrackPULL Tractor is built on a substantial track 12 inches by 32 inches on the ground. The power in the tractor pulls it along its own revolving track. That's why it does not pack the soil — gets long traction — turns easily to right or left—can make a complete turn in a 10-ft. circle, is most economical in operation and a boy can easily work it. When the hot days come your team loafs and you get only an average half day's work done in 10 hours. The Bean TrackPULL will work day and night if you want it to and does the work all day long that a six-horse team could do if they worked hard continually.

The Price is Only $975.00

Bean TrackPULL Tractor construction consists of a 10 H. P. (at belt) Le Roi 4-cylinder vertical type—4-cycle motor. Equipped with Donaldson air clarifier, Bosch ignition, Perfex radiator, water cooled with centrifugal pump and fan, combination splash and pump lubrication, Hyatt roller bearings in track wheel sprocket and track rollers, six New Departure ball bearings in the transmission, running in grease and dust-proof. Gears are steel. No differential or other complicated mechanism.



Making Figure 8 around trees and leaving no unfinished work.



Pulling a spring track cultivator between rows 12½ feet apart.

Prompt Deliveries in April

Our entire output is sold a month in advance and we are working night and day. We are building a large addition to our factory to increase our capacity so that we will be able to ship tractors that are ordered now, in April.

We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

It now looks as if the owner of an apricot orchard not in the frost injured belt has assurance of good returns this year. Long prices are already being offered and every indication goes to show that best of care should be given to every orchard. The view on the cover this week was taken in Southern California and is typical of thousands of orchards in all parts of the state.

BLOSSOM TIME

Who would not live in California these days when the atmosphere is heavy with the fragrance of the orchards in full bloom and where color runs riot in the wild blossoms over the fields? California never looked more beautiful and never had more perfect days. But, just as a mere hint, one more rain, please.

KEEP THEM AT HOME

No question comes to the Cultivator's legal department so often as one regarding relief from stock trespass. We have seen, in more or less humorous vein, the statement; "Man's first duty to man is to keep his hens at home." There is so much truth in this saying that it is worth memorizing. Neighborliness disappears when one finds crops destroyed, especially where polite request for relief has been unheeded.

There is in California no law which seems to fit this trespass question, but who wants to live in a neighborhood where law has to be invoked to secure common right or justice? Let us all corral our hens and tether our stock securely.

COSTS OF SANITATION

The cost of stamping out the foot and mouth disease was in excess of $9,000,000, this both to the federal department of agriculture and to the departments of several states which aided in the campaign. The department says, however, that large as this amount is, it is trivial compared with the colossal damage which would have been inflicted had the disease escaped control. We believe that the time will come when the war against tuberculosis will be almost as severe as that which was waged against the foot and mouth.

USING MORE POWER

The department of agriculture issues information regarding the number of tractors in use in the various states. While California was one of the first to begin use of farm tractors it has been passed by a few of the states in number now owned. California has 1358 tractors, while Illinois has 3200, Kansas 2200, Minnesota 1500, Nebraska 1700, North Dakota 2100 and Texas 1700. All other states are using a fewer number than California.

We may be mistaken, but our guess is that the next year will show more rapid increase in the use of tractors in California than any other state in the Union. All told, in the United States there are now in use about 34,000 tractors. None of these figures are absolute, but they show the relative employment of tractors in the different sections.

LADY BIRDS

One indication of the greater planting activities in California this year has been shown in the demand for lady birds, or hippodamia convergens, made of the state insectary. For years the state horticultural commission has gathered in the Sierra Nevada millions of these little friends of the small crop grower. They have been collected by the bushel, brought to the state insectary, kept in cold storage and later shipped to various portions of the state. The Imperial Valley received the first consignment of these lady birds years ago, and it was found that they aided materially in controlling the aphis. Now the bean growers have learned of their value, and this year San Luis Obispo County applied for a great number of them. In fact the order closed with: "Be sure and send at least a carload."

The "bug to eat the bug" seems to be the only economical way to control this pest. We hope that new fields where the lady birds may be secured will be found another year.

BENEFITS FROM QUARANTINE

For many years Swiss farmers have looked upon the foot and mouth disease as a necessary evil. So far as possible they have tried to control it in a general way, but not until the past few months has the American plan of combating it been tried. Their agricultural interests had suffered fearfully, and practically all stock exports had ceased, and the dairying and meat producing industries had been almost ruined. Swiss scientists had decreed that the meat of these animals was edible, and at the beginning of the war much of it was fed to European troops. Quarantine was established and moving of stock from mountain to valley, and the reverse with the seasons, was prevented, and many cantons have been declared entirely free from this dread disease. It is now thought that no section of the country will harbor this pest within the next few months.

CROP REPORTS

With the understanding that we may change or revise our figures entirely within the next few weeks, we would like to predict that the apricot output this year will not be half of normal. As many of our contributors have said, it is altogether too early to make any definite estimate, but it is almost criminal not to look ahead and get every possible item of information we can regarding this season's production. So the Cultivator, as it has done for many years, makes thus early in the season a canvass in which it has been more generally aided this year than in any preceding year by subscribers, by the horticultural commissioners, the farm advisers and others. It will be noted in the reports appearing on several pages of this issue that estimates vary from ten per cent to 100 per cent of a crop, but taking the larger producting sections into account a fairly satisfactory guess may be made that 30 per cent of normal will not be far out of the way.

The Prune and Apricot Growers, Inc. is making appeal to every producer in the state; "Don't sell your children's birthright for a mess of pottage." If the cooperative association is supported and the growers will not permit themselves to be stampeded there should be satisfaction in being a deciduous fruit grower this year.

TO MEMBERS OF COW TESTING ASSOCIATIONS

COW testing associations are increasing; their work is invaluable and dairymen are richer because of it. In the state dairy cow competition the Cultivator is endeavoring to advance the work of these associations by offering prizes for highest testing herds. At first the announcement was made that these tests should be under the direction of a man from the state university who should make regular monthly inspection and tests. This made the cost to each competitor too great, as the competition covers a period of 12 months, and so a change was made, and Prof. Woll, who has this competition in charge, ruled that "the terms for the award of the three prizes of $100 each (offered by the California Cultivator) for the highest average production of butterfat for one year by herds owned by members of a cow testing association, have been modified so as to leave the certification of the yearly reports in the hands of the officers of the association. No monthly test checks will be conducted by the college of agriculture in herds competing for these prizes, as will be the case for cows in cow testing associations competing for other prizes, for records by individual cows or by groups of cows in the same herd."

This ruling was not understood by many dairymen who now express a desire to enter the competition. To encourage the industry and these dairymen the time for entry has been extended to May 1. This can only be taken advantage of by those who have been members of associations and whose records have been kept by the regular cow tester of the association, for while entry may be made as late as May 1, the records upon which the competition will be based may begin any time between November 1, 1916, and March 1, 1917.

There are now entries in all of the three classes, that is, dairies of ten to 25 cows, of 26 to 50 cows, of over 50 cows. Remember the winner in each one of these classes, at the completion of the contest, March 1, 1918, will receive the Cultivator's check for $100.

Write at once to Prof. F. W. Woll, University Farm, Davis, for entry blanks and information.

Old Style Grafting

Ruins Trees
Destroys Crops
Grafts often broken by wind
Limbs split and decay

Our Method of Side Grafting

Remedies all this. Saves wax. Saves labor. Grafts grow better and mature sooner than by any other method. It will work over your Grapes and Citrus Fruits with practically perfect results. Full information sent free.

Agricultural News Notes of the Pacific Coast

Northern California

A delegation of state legislators visited the university farm at Davis last week.

San Francisco houses are reported to be contracting prunes in Colusa County at six cents.

The citriculture class from the state university has been making a tour of citrus and olive orchards in Butte County.

Ranchers of Westport, Mendocino County, are planning to plant many green beans this season to sell to the cannery.

Colusa County is planting largely to sugar beets this season. Beet dumps are now being constructed at Princeton and Colusa.

At a mass meeting in Yuba City over 200 farmers voted to levy a tax of ten cents an acre to finance a fight against the placing of the Sutter bypass on the east side of Sutter Basin.

The supervisors of Glenn County have appointed C. Hugh Wren, of Orland, horticultural commissioner to succeed Carl J. Ley, who resigned to accept a position as manager of a large ranch.

Peach growers of the Gridley Farmers' Union report sale of all their 1917 crop at $40 for all clings, $25 for Lovells and $22.50 for Muirs. The members' peaches were pooled, amounting to 1000 tons.

George H. Ayers of Fort Bidwell has applied to the state water commission for permission to appropriate 575 cubic feet per second of the waters of Cowhead Lake and 125 cubic feet per second of the waters of Twelve Mile Creek.

At the recent meeting of the Glenn County Agricultural and Live Stock Association J. A. Flaherty of Orland was elected president, Ed. Kirk secretary, and Dr. W. H. Walker of Willows director to succeed James Mills, resigned.

Central California

The Newman creamery is installing a casein plant.

Fresno County is to have a new farm adviser appointed April 1.

Many reports have been received of offers of $40 for canning peaches. Some are reported at $42.50.

Twenty thousand additional acres will be placed under irrigation from the Turlock district this year.

Bean canners have been endeavoring to interest ranchers of Tulare County in contracting large plantings.

The Valley Fruit Growers' Association is conducting meetings of vineyardists at various points through the valley.

The Stanislaus County board of supervisors has let seven contracts for construction of 55 miles of county highway.

The Coalinga Poultry Association has been notified by the state poultry association that its third annual show will be held at Coalinga.

Cantaloupe growers of the Turlock district have petitioned the legislature to amend the Ashley standard pack bill to include various cantaloupe packs not now allowed.

Manager Niswander of the California Peach Growers' announces that damage to the peach crop from the recent frosts was very slight and occurred only in a few sections.

Reports from several nurseries indicate that at least 20,000 acres will be planted to grapes in the raisin belt this season. This includes Fresno County, the northern part of Tulare and the eastern part of Kings.

The Merchants' Association of Fresno has practically secured funds necessary to secure the establishment of a plant of the Universal Meat Packing Company. The proposal is to provide a site for plants which shall cost at least $250,000.

Southern California

Oceanside, San Diego County, has started its anti-fly and mosquito campaign.

Riverside County fair directors have fixed dates of their fall fair at October 9-13.

Imperial will have an extension of its rural delivery postal service west of New River.

The cotton gin installed last fall at Brawley has closed its season's work with a total output of 1423 bales.

Imperial County's cantaloupe acreage this year is estimated at 12,700 acres, an increase of more than 4000 acres.

Coachella has organized a local branch of the Riverside County farm bureau. It starts with a membership of 76.

Reports from various sections of Ventura County indicate damage to the apricot crop from the recent frosty nights.

Coachella Valley date growers have reorganized their association. Fifty-six members have now signed up, W. L. Paul being elected president.

A mass meeting was recently held at Hemet to encourage planters to put in 10,000 acres of sugar beets in order to secure the building of a sugar factory.

A Jersey Breeders' Association has been organized at Riverside with Geo Thomas, president; W. E. Rough, vice president, and W. P. McClasky, secretary.

Secretary Houston of the department of agriculture has been invited to attend the state fruit growers' convention to be held at Riverside June 4-9.

Brawley, Imperial County, held a pig club show last Saturday. The pigs were judged by Prof. True, head of the animal husbandry department of the state university.

The Coast

Yakima County Washington, will soon have a county agent appointed.

The Monkland district of Oregon has formed a Percheron association.

Twin lambs are reported unusually plentiful in Oregon flocks this spring.

Northwest potato growers are hoping that the introduction of sugar beet growing will help to eradicate potato diseases.

The state board of control of Washington has fixed the prices of grain bags manufactured at the penitentiary at 10½ cents.

Stockholders of the Eugene, Oregon, Farmers' Creamery, a cooperative organization, are planning to start a cheese factory.

Bend, Oregon, reports thousands of cattle suffering for lack of pasture, caused by the prolonged cold weather and heavy snows.

The St. Joseph Farm Improvement Association of Navajo County, Arizona, is buying seed and many other supplies cooperatively.

The wagon road from Grangeville to Elk City, Idaho, will be finished this spring, the state and county cooperating with the forest service in the work.

Farmers of the Gila Valley of Arizona have formed a buying and selling exchange to procure supplies in quantity and grade and pack produce for market.

In a case recently coming before the supreme court of the state of Idaho the state law forbidding the grazing of sheep within two miles of the residence of another person was held to be constitutional.

Traffic managers of fruit interests of the Northwest, representing some 12,000 carloads, have formed an organization. They will study problems of uniformity and improvement in storage, icing, weights and claims.

Strain of Bees

Written for California Cultivator By G. W. Bercaw

JUST exactly what strain of bees to start with or to change over to afterwards depends mostly upon individual taste. It must be admitted by those that have had experience that our native strain of honey bees has some good qualities, possibly some bad, but we will ignore the bad, only look for the good. In the production of comb honey in our own yards we have found that our native black produces and caps the whitest and clearest comb honey; but this might not be the experience of others. Add to this that these black bees are most probably the crossest and most inclined to sting, either a trespasser or a beekeeper. For an all around, reliable, gentle bee, we have found the leather colored or three-band Italian bees are the best for storing extracted honey and they do very well for comb honey, too, if handled properly. There is a strain called Golden Italians which are fine looking bees but for the production of honey we have not found them equal to the others. Since the breaking out of the European war it is difficult to import Italian bees, but if one can get good stock from Italy and cross with our native Italian drones, there is no better strain of bees, all things considered. Importing queen bees from foreign countries is a risky proposition, and on the average about three-fourths arrive dead. We have had consignments of 12 queens from Milan, Italy, to arrive with all attendant bees dead and only six queens alive, the queen seeming to stand the trip better than her attendants. It is acknowledged by nearly all prominent beekeepers that a good strain of Italian bees is the best resistant stock to our commonly called foul brood. Just why this is it has not yet been definitely solved but it may be that good Italian bees are better housekeepers.

Artificial Increase

Written for California Cultivator By Henry Perkins

THERE are many methods of artificial increase. Mine is to pick a colony which has at least a brood chamber full of brood and bees. I set an empty hive beside it. I next hunt out the queen and set the comb she is on to one side then put one half of the brood and as nearly as I can estimate, one-quarter of the bees in the new hive. I then replace the comb with the queen in the original hive, fill it out with combs or frames set with foundation, close it and carry it to a new stand at least 50 feet away. I return to the new hive and after filling it with frames, place it on the stand orignally occupied by the parent hive, with the entrance facing the same direction.

I am careful to select a bright warm afternoon for the work. It should be done shortly after noon. The bees which are out at the time the dividing is done will return to the orignal stand and serve to reinforce it to a strength that should be sufficient to care for the brood.

The operation will have a paralyzing effect on the activities of the parent colony for a few days but it will soon renew its efforts to increase its strength. I am always careful to see that both colonies are well supplied with honey unless there is a heavy flow on at the time.

Now the new colony will as a matter of course be queenless and immediately begin starting queen cells. It is just as well to leave them alone for five days. By that time the cells should be sealed. I select the largest cells and destroy all the others. If however I have queen cells in the yard which are more advanced or from choice stock I destroy all the cells in the divide and give them one of my own preference. In some cases they will destroy a foreign cell, but not often, provided they have been five days queenless.

In transplanting queencells from one hive to another it is best to allow a lapse of at least one day between the time the cell is given and the time it is due to hatch. This provision gives the bees opportunity to discover that their own cells are gone and their sole reliance for a queen is the introduced cell. This brings up the question, "How is one to tell the age of a queen cell?" In the Cultivator of June 22 I gave the periods of the queen cell. If you know the date the egg was laid you can figure 14 days till hatching. A little investigation of the inmates of superfluous queen cells will soon train the eye to a sufficient accuracy. A queen cell once torn open is worthless but its appearance may furnish the key to the age of its sister cells.

Increasing bees is a big subject with as many exceptions as rules. To know all about increasing is virtually to know all about bee keeping. Don't be disheartened if you fail in your first attempt. I often err in my calculations even yet.

BEES ARE NOT TROUBLESOME.

To the beginning beekeeper, his first attempt to open the hive and handle the combs and bees may be beset with some difficulties, but in time this becomes the most fascinating part of beekeeping. Leonard Haseman of the Missouri college of agriculture would have the beginner study the bees, their habits, nature, likes, and dislikes, and then accustom himself to their ways. The honey bee is not a vicious creature, and if given anything like the consideration it deserves it will not fight.

Careless or nervous handling will start trouble in any bee colony. A veil should be worn to protect the face. Cool smoke should be used sparingly at the entrance and under the cover as it is being gently raised. Smoke may be used to induce the workers to fill their honey stomachs with honey. In this condition they are less likely to sting. Pinching bees between the fingers invites trouble as it is their privilege and nature to resent such careless treatment. The warm part of the day when the workers are actively gathering nectar or pollen is the best time to handle the colony, for at such times there are fewer bees in the hive and those present are more docile. The brood chamber should not be opened when the weather is cold, if it can be avoided, for the queen and the brood may become chilled.

These are a few of the precautions which the beginning beekeeper in particular should keep in mind. A careful study of the bee and its life and habits and a little effort to adjust one's actions to those of the bees will soon make beekeeping both an interesting and profitable pursuit. Every farmer should produce his own supply of honey by keeping and properly caring for a few stands of bees.

Soldier's Exemption

Is an honorably discharged soldier exempt from irrigation tax on a town lot?—Subscriber.

An irrigation tax, or any other local assessment, upon a town lot usually proceeds upon the presumption that the property itself has been benefited thereby. While the writer, in view of the lack of any definite decision on this point, cannot authoritatively state, it is the opinion that the soldier's exemption does not cover an irrigation tax or other local assessment.

Barbed Wire Fencing

I wish to ask if there is a law against the use of barbed wire "of any kind" being used for fence on ranches in California? Are we liable if loose stock gets cut on such a fence?—Subscriber.

The liability for injury caused by a barbed wire fence seems to depend upon whether or not the fence was well constructed. A judgment for damages for injury caused by a barbed wire fence, the wires of which were not properly stretched but were left hanging loose between the posts in such a way that stock were not likely to see them, has been affirmed upon the ground of such negligent construction by the supreme court of this state. In this case the court stated that the question was one of negligence in the construction of the fence, which was to be found by the jury.

Renewing Mortgage

Will you please tell me if a payment upon a note and mortgage that is overdue in the state of Arizona will renew it without making a new mortgage and recording it?—Subscriber.

The general rule is that a partial payment or payment of interest is a sufficient acknowledgement of the indebtedness in order to take the indebtedness out of the statute; but in California, and in many of the Western states, following the California code, an express promise or acknowledgement in writing is required, and a part payment or payment of interest is not available. It would probably be sufficient, however, without re-recording a mortgage, to execute a renewal of the note. Due care must be taken in this respect, however, in view of the fact that it has been held in some states that even though the debt is renewed by acknowledgement after lapse of time of the statute, nevertheless the lien of the mortgage, having once expired, cannot thereby be deemed to have been renewed. Such case, therefore, might arise that you might have merely an unsecured, renewed debt.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Mange Cure

A Colton subscriber, referring to inquiry of Mecca subscriber in a recent Cultivator as to cure for mange on horse writes:

"I breed rabbits, and one of my large Belgian does was afflicted with mange; a place two or three inches square on her breast was entirely devoid of fur. I made a strong solution of permanganate of potash and applied but twice, and the place healed permanently. That was a year since. It might be the remedy for such disease on any animal."

What are Pedigreed Trees? We want You to Reason Before You Buy Citrus Trees.

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries,—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertilizer, labor, investment tied up in land—these are the big factors that go to pot if, years after the trees are planted, the grove bears miscellaneous offspring.

gated. Would the beans require water?—Subscriber, Hughson.

Blackeyes, pinks or Teparies would do well with you. Irrigation increases the yield and might be necessary, especially with the first two varieties named. That depends entirely on your soil, subsoil and manner of treatment. If the ground has been plowed during the winter and has taken in all of the rain and been kept in good tilth so that no moisture has been lost dry farming might be possible.

Barley for Soiling

Please advise if it would be a safe practice to allow cows to eat all the green barley, just heading out, they want.—Subscriber, Fullerton.

We see no harm in feeding dairy cows on such soiling crops. Such crops are not liable to cause bloat and would make a nutritious feed.

Guernsey-Jersey

Do the general characteristics of the Guernsey cow trend toward the Holstein or the Jersey?—Subscriber, Fullerton.

The Guernsey and Jersey are closely related or, more correctly, they come from the same French ancestry of Brittany and Normandy cattle. The islands of Guernsey and Jersey, both in the English channel, about 14 miles from the coast of France, are the homes of these two breeds. On the island of Guernsey there are only some 12,600 acres and on the entire isand not more than 5000 head of cattle. The island of Jersey has nearly 29,000 acres and perhaps about 40,000 cattle are kept on the island, all of the Jersey breed. On the other hand, the Holstein-Friesians were bred for centuries in Holland and Northwestern Germany and Belgium. The first Holstein-Friesians were imported to New York some 200 years ago.

Beet Pulp for Poultry

Please give analysis of beet pulp and advise whether it would be advisable to use as a poultry food, and to what extent.—Subscriber, Glendora.

Dried beet pulp, according to Woll's "Productive Feeding," contains 60 per cent nitrogen free extract, 17.5 per cent fiber, 8 per cent protein. It contains 4.1 per cent digestible protein, 64.9 per cent carbohydrates. It may be fed to fatten steers, dairy cows and sheep, but we have no report as to its trial with poultry excepting that Dryden's "Poultry Breeding and Management" says: "Dried beet pulp is now used to a considerable extent in stock feeding. It may be used as green feed for poultry. In addition to its value as a succulent food it contains a fairly high percentage of mineral matter. This makes it of more value than some other green feeds. There is little authoritative data on the subject of beet pulp as a poultry feed, and at the present time it should be used experimentally."

Ducklings With Weak Legs

I have read the answer to my inquiry on the baby turks and thank you very much. Since feeding them according to your directions have not had any more trouble.

I am now having trouble with my two-week old ducklings. They begin to tremble when they walk, keep getting worse until whenever they try to walk they roll on their backs and can't get up.—Subscriber, Coachella.

Your ducklings' bodies are getting too heavy for their legs. This may be for lack of meat in the ration—you do not mention feeding beef scrap in the mash—and it may be that you are feeding too heaviy with the bran mash. A little fine ground bone in the mash will help to strengthen the legs. Exercise will also help. Ducklings that are confined are quite likely to have weak legs. The mash should be about one-third green feed. Lettuce cut up fine is best for them at this age. A mixture consisting of three parts bran, three parts chopped greens and one part each of corn meal, middlings and beef scrap, with about three per cent fine sand or chick grit, the whole moistened till it is crumbly, makes a satisfactory ration for duckings of this age. Care must be taken to add the beef scrap gradually to the mash. Begin with a very little and increase until the required proportion is reached.—J. A. K.

TALKS ON
Nitrogenous Fertilization

Number 12

INTERESTED readers of our "Talks" are asking why Sulphate of Ammonia meets the nitrogen requirements of California soils so well; how it is held in the soil and converted into plant-food; how quickly and for how long its plant-food is available to the plants. For answer, let us glimpse briefly at one of Nature's wonderful processes, which like the brook goes on forever undreamed of by most of us.

All California soils contain alkaline (basic) substances, occasionally in proportions that might limit or hinder plant growth. In so far as it can,

SULPHATE OF AMMONIA

combines with them, the consequent reaction resulting in the formation of ammonium carbonate. A tendency toward soil alkalinity is thus checked, the Sulphate breaking down so that the humous compounds can absorb and hold its ammonia-nitrogen.

Two distinct types of bacteria, and possibly other soil organisms, complete the nitrification process. Under their activities, the humous-bound ammonia is released as nitrate-nitrogen. These manufacturing processes progress steadily, delivering food to the plants about as fast as they can use it.

Quick-acting, all-available, enduring, highest in nitrogen, Sulphate of Ammonia is especially fitted to fill your needs for nitrogenous fertilizer.

15-35 Model E
BURNS KEROSENE

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

FOR great power, working flexibility, reliability and durability, the 15-35 Model E Sandusky Tractor stands in a class by itself.

Proof of this is found in the increasing number of farmers who are its enthusiastic endorsers because of results obtained on their farms. and in the growing list of imitators who follow its progress.

Reason for this admitted superiority exists in the engineering skill that designed this tractor, the excellent workmanship that goes into it, and the highest-class materials used in its construction. The completed tractor was tried out by exhaustive tests before it was offered the public, and the result of these tests has been emphatically endorsed by hundreds of users.

Fifteen horse power guaranteed at the drawbar, with 33⅓ percent reserve; thirty-five at the belt. Direct drive on all heavy duty work, and ease of handling, with its reliability, make it the ideal tractor.

You get *tractor certainty* when you buy a Sandusky, because service and long life are built into it in the first place, and because all the experimental work is done at our expense before you are offered the machine.

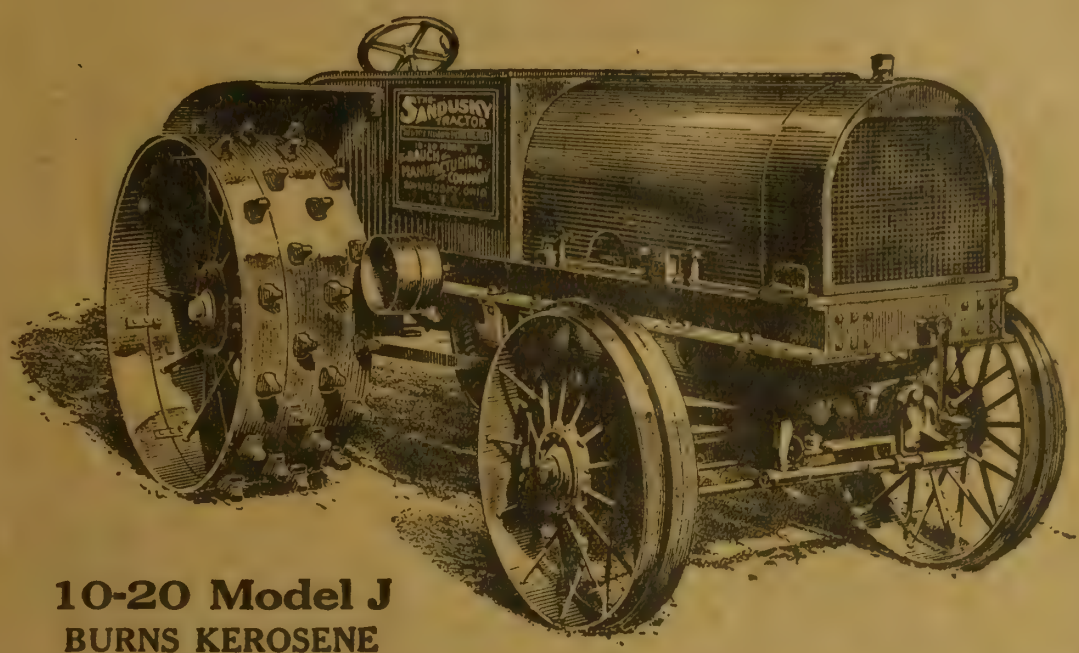
And you buy *with certainty* as well. You must try our tractor on your own farm, doing your own work, before it is yours, and it must convince you by actual service that it is adapted to your needs.

The Sandusky Tractor on your farm will economically do your plowing at the right season; do your harvesting when your crops are ready, disc, harrow, thresh, haul, fill silos, crush rock, shred fodder, saw wood, build roads and do a hundred other tasks that keep it busy for you and your neighbors all the year round, to your great profit and satisfaction.

BOOK E-16 FREE.—A 40-page book which fully describes and illustrates the distinctive design, high grade construction and exceptional ability of the 15-35 Model E Sandusky Tractor. A copy will be mailed you upon request. Be sure to ask for Book E-16

THE DAUCH MFG. COMPANY

A NEW PLAN—FREE SERVICE. We announce an entirely new departure in tractor selling. A coupon book good for 200 hours of service goes with every Model E; a similar book for 100 hours with every Model J. This means expert advice and help without charge when you want it. See catalog for details.



10-20 Model J
BURNS KEROSENE

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

WHERE the volcano of power presented in our 15-35 Model E is not needed, but where a sturdy, efficient and durable tractor is sought, the 10-20 Model J Sandusky solves the problem.

It isn't because it is lower priced, but because, for the smaller farm, the Model J, pound for pound, is every bit as good a tractor as the Model E.

Highly trained engineers have spent years of study on it; skilled workmen have carefully wrought the best materials into the engineers' designs, and *three years* of constant field development, of careful tests, of hard work under adverse conditions, have thoroughly demonstrated the practicability, the economy and the absolute reliability of the Model J.

Hence it is guaranteed as a profitable servant on the farm, to do your plowing, harrowing, discing, harvesting, threshing, silo filling, fodder shredding, wood sawing, road building, hauling, etc. We show you on your own farm that it will do your work---that it is adapted to your needs---that it is capable, efficient and economical.

Behind it we put a guarantee that means much; the faith of our organization and the standing we have built up by years of honest dealing. All of these say to you:

"Buy the Model J Sandusky Tractor. It will serve you faithfully, make your farm work more productive, decrease your farm expenses and ease your labor. And it does not cost any more than the good horses it displaces, while its working capacity is so much greater that you will actually make money with it."

BOOK J-15 FREE.—Describes the unique principles of design, construction and performance of this smaller machine. Also gives details of our "Try It Before You Buy" sales policy, and our broad, binding guarantee. Be sure to ask for Book J-15

Remco Redwood Silos

Are more than just GOOD—they are BETTER

WHY?

They are made by a company that has had twenty-eight years' successful experience in the manufacture of wood tanks and pipe, and can point to thousands of installations that have stood the test of the severest service continuously without break;

This experience has proved definitely and conclusively that REDWOOD, air-dried, is the best material in existence for silos.

More than forty million feet constantly on hand insures the use of none but air-dried redwood for any REMCO product; stave material is carefully selected for its adaptability for that specific purpose.

REMCO REDWOOD does not rot or decay. The chemical action that converts raw, chopped feed into ensilage does not affect the REMCO silo.

Years, and more years of CONTINUOUS, SATISFACTORY SERVICE is the outstanding characteristic of REMCO products.

Specify REMCO, and convert silo expense into an investment. Full particulars on request. Write to us.

Redwood Manufacturers Company

1604 Hobart Building San Francisco, Cal.

Santa Anita Rancho

Anoakia Breeding Farm

ARABIAN-THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Colesho Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

Number of Small Flocks Increasing

Written for California Cultivator By W. S. Guilford

THERE is a gradual increase in the number of small flocks of sheep throughout the state. It may be some time before this phase of the industry has any great effect on the supply of mutton, but it is sure to eventually.

Some of these small flocks are started by the purchase of a few old ewes from some range flock. Such ewes are too old to be able to compete successfully for feed on the range with younger animals, while with better feed conditions and shelter they will live and raise lambs for two or three years more on the farm.

I know of one nice little flock that was started by the boy of the family going every day to a nearby lambing ground and getting such lambs as were not owned or for some other reason would be lost. These he brought home on his bicycle, fed them warm milk from a bottle, and before long he will have one of the most profitable departments of the little farm.

The owners of all of these small flocks will be customers for good pure bred rams, which will make it sure that high class mutton will be produced.

Look Out for Necks and Shoulders

The heavy winter coat is "slipping" now, and with the warmer weather the mules and horses are sweating freely. Now is the time to pay particular attention to the necks and shoulders. They should be cleaned thoroughly, and the collars should be scraped and kept clean.

Some claim that washing the necks and shoulders with cold water or soap and water or salt water every night makes the parts more tender. I have noticed that the teamster who does this, and carefully cleans the collars, has the fewest sore spots and the best looking teams.

In some parts of California curry-combs and brushes are unknown quantities. I do not see how anyone with a whit of pride can work a dirty team. It takes such a little time to clean up a team in the morning, and there is so much satisfaction in it that every one should do it. And the animals will appreciate it.

What the Testing Association Did

A good dairyman at Orland had four grade Jersey cows in his herd. He knew that they were good cows but would undoubtedly have sold them for $100 each. Then the Orland Cow Testing Association unit of the Glenn County farm bureau was organized. On the showing of actual returns, as indicated by the test, these cows were sold to a neighbor for $150 each.

Lots of Pigs Coming Now

February, March and April, these are months when many pigs are born in California. And the grower is lucky who has plenty of grass for them. Alfalfa in separate lots for sow and litter is an ideal condition.

There is a great difference in sows in the way they care for their pigs and in the amount of milk they give. No inflexible rules can be made for the culling out of sows, for a young sow that may have a small litter, be nervous and fretful and kill most of them may from that time on produce good litters and raise them well. But there are some sows that with the best of conditions are poor mothers. These should go to market.

Little pigs should have plenty to eat as soon as they will eat it. Their best food will be their mother's milk but they will soon learn to go into a creep for skim milk and a little corn or rolled barley and will take a bite of a mineral mixture. All of this is good for them. Gains made at an early age are the cheapest an animal will ever make.

The weather is good almost everywhere now, but there should be a dry bed for sows and pigs when it rains.

California Beef Cattlemen Waking

Written for California Cultivator By F. F. Stonerod

ORGANIZED primarily to reduce range losses from cattle stealing, the Central Stockmen's Association, W. S. Everts secretary, and Howard V. Jack, president, is commencing to branch out and make the organization a real power for good among the state cattlemen. This organization includes stockmen from Fresno, Kings, Kern, Monterey, San Luis Obispo, Santa Barbara, and Tulare Counties, but its success has been so encouraging since the day it was formed that it is gradually absorbing members from other counties.

Anything that affects the cattle business adversely or otherwise is receiving prompt attention at the hands of the wide-awake committees. Probably no other state in the West needs more organization and reform in its livestock industry than California. Obsolete methods of marketing, lack of competitive buying from the producer, lack of a law requiring registration of marks and brands, cattle inspection, etc., are only a few of the many reforms which the industry urgently needs.

A senate bill covering most of the above points is now in committee at the present session of the legislature. It is Senate Bill No. 150. It calls for the creation of an inspection board to administer the act if passed and prescribes penalties for the violation of the provisions thereof. This identical bill was passed by the legislature last year but was not signed by the governor. As every objection to the 1916 bill has been met the strong support of the cattlemen at this time will doubtless make the bill a law. A feature of this bill is that it will not create any new expense to the state as the fees for inspection and license will defray the entire cost. The public, after a law of this character is in effect, will have authentic data as to where our cattle are shipped and where and how they are slaughtered. Arizona has had such a law as the one herein de-

Retained Afterbirth

When the membranes remain in the uterus of a cow and decompose, inflammation of the lining of the womb may be caused, and this, with the absorption into the blood of the products of putrefaction, lead to ill-health, emaciation, diminished milk supply, failure to breed, and often blood poisoning and death. HOOD FARM BREEDING POWDER causes the afterbirth to come away naturally in a few days, and thoroughly cleanses and disinfects the parts, leaving the cow in normal condition for breeding. Write for full information and prices, mentioning this paper.

Half a Cow—

Half a cow means half a profit—really a loss, because a poor producer costs as much to keep as a good milker. If you have a cow that is below par, chances are some vital organ is impaired and she needs treatment.

Kow-Kure is the one cow medicine that quickly tones up the digestive and genital organs and puts a backward cow on her feet. Try Kow-Kure on your most doubtful cow. It is especially effective for the prevention or cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Lost Appetite, Scouring, Bunches, etc.

Sold by feed dealers and druggists, in 50c and $1.00 packages. Write for free book, "The Home Cow Doctor."

scribed for years and would not be without it. It has saved the cattlemen vast sums of money and benefited the industry in many other ways.

Only by cooperation can the live stock men of the state ever hope to better present conditions. While the central Stockmen's Association takes in the largest beef territory in the state there are other sections which should be formed into similar organizations. Imperial Valley is a great feeding ground. There is quite a large range country between Los Angeles and the Mexican line; north of Sacramento and in the counties adjoining Nevada are hundreds of cattlemen who should organize for their mutual benefit. With the beef cattlemen, the dairymen, the swine and sheep men organized into one general livestock association we would be able to secure desired legislation and in all probability better marketing methods and stockyards.

When that happy day arrives California growers will be in a position to make real progress toward prosperity in the production of meat animals. Verily, "In union there is strength"; unorganized the stockman is helpless.

DIRECTORS' MEETING STATE SWINE BREEDERS ASSOCIATION.

Written for California Cultivator By C. A. Briggs.

At the regular director's meeting of the California State Swine Breeders Association at the Travelers Hotel, Sacramento, on March 16, a plan for the annual meeting on May 30 was adopted. There will be a directors' meeting and election of officers in the morning and a donation sale in the afternoon. At this sale the leading breeders of all breeds will offer some of their best animals for the purpose of getting good blood of all lines into the hands of the farmers of the state. Twenty-five dollars from the sale of each animal will be donated to the general fund of the Swine Breeders Association for the promotion of the work. After the sale Prof. Thompson will close one of the university farm's swine feeding experiments, to which all are invited. These experiments which have been conducted for several years are extremely instructive and should not be missed. In the evening a banquet will be held, and speakers well posted on the subject of hogs will provide a valuable and interesting time for all attending. The work of the State Swine Breeders Association is of increasing value to the industry and should have even stronger backing than it has. Its officers are earnest, self-sacrificing men who serve without salary and pay all their own expenses. A most cordial invitation is extended to every one interested in "more and better hogs" to be at Davis on May 30.

FIELD NOTES FROM THE LIVE STOCK MEN

W. A. Young of Lodi reports recent sales: Three bred sows to H. C. Carr, Tulare County, for boys' pig club; one bred gilt to Chas. S. Harkins, Kern County; one bred gilt to H. F. White, Amador County; two bred gilts to Fred Villenger, San Joaquin County; one service boar, one bred gilt to the Gammon Estate, San Joaquin County; one boar pig to M. L. McDonald, Stanislaus County; one two-year-old sow to Paul Hopkins, Glenn County, one two-year-old sow to M. C. Freeman, Yuba County; one service boar to V. D. Goodrich, Santa Clara County; one service boar to Denner Bros., Santa Clara County; one sow pig to J. G. Wise, Nevada.

Frederick M. Johnson, Napa, reports recent additions to his herd of registered Duroc-Jersey hogs: A yearling sow, bred by the Economy Stock Farm, sired by Burke's Good Enuf and out of a Gano sow. A Cherry Chief fall gilt bred to Critic D. A daughter of Joe Orion II, bred to Indianwold's Orion Cherry King. A spring gilt bred by the university farm, a granddaughter of Col. Protection. A September, 1915, gilt, sired by Pathfinder and out of a Disturber sow.

H. P. Slocum & Son report the sale from their recent Eastern purchase of pure bred hogs, of two sows bred to Giant Col., whose sire was King's Col., to Geo. A. Spencer; nine to Spalding Company, six head for shipment to Honolulu; three bred sows with championship ancestry to Wellington F.

DE LAVAL

The First, the Best Known and the Greatest

CREAM SEPARATOR

Better Now Than Ever Before

THE first practical continuous cream separator, the De Laval has easily maintained its original success and leadership for nearly forty years. Step by step, year after year, by one improvement after another, the De Laval has led in every single step of cream separator development and improvement.

The first belt driven, the first steam turbine driven, the first of every kind of hand turnable, the first disc bowl, the first blade bowl, the first bottom or suction feed, the first split-wing feed, the first feed-through-the-discs, the first self-centering bowl, the first automatically oiled—all these and a hundred other features of separator development and improvement have been conceived by De Laval inventors and perfected by the De Laval Company, most of them to be cast aside for something still better in the ever onward advance of De Laval construction.

The New 1917 De Laval

And now, in the De Laval machines for 1917, a number of new and still further improvements have been made, which make the De Laval machines of today much better in many respects than they have ever been before.

Their capacities are greater per dollar of cost; they skim cleaner under the more difficult conditions of separator use; they are equipped with the most improved speed regulator, thus insuring the proper speed necessary for complete separation; they are even better lubricated, and the bowl construction is even more sanitary than ever.

In other words, superior as the De Laval machines have always been to all would-be competitors and utilizers of abandoned De Laval features, the De Laval machines of 1917 are improved and superior in every way to all previous types and models of De Laval construction.

All these improvements and new features are described and explained in the new 1917 De Laval catalog now ready for mailing, but some of them are difficult to describe and make fully understood by words.

Be Sure to See a New De Laval

The new De Laval machines themselves best explain their new and superior features, and their use does this more completely and convincingly than even an examination of them. Every local agent is glad to afford opportunity for examination, and better still, for home test of a new De Laval machine.

But the demand for the new machines is a month ahead of the possible supply under the present difficult conditions of manufacture and freight distribution. More De Laval machines by half have been made in 1917 than ever before, but the De Laval Works is now ten thousand machines behind actual orders, and the demand is ever increasing.

Hence, the importance of securing a machine quickly if your local dealer happens to have one, and of ordering well ahead if he does not. And likewise, the importance of waiting patiently a little for a machine if need be.

A new De Laval catalog will be gladly sent on request, and if you don't know your nearest local agent please simply address the nearest De Laval main office as below.

400 Pounds Butter in 90 Days

AAGGIE ACME OF RIVERSIDE 2d

California State Butter Record

Butter 7 Days 35.38 Lbs. Milk 627.3 Lbs.
Butter 30 Days 142.34 Lbs. Milk 2730.7 Lbs.
Butter 60 Days 275.02 Lbs. Milk 5365.0 Lbs.
Butter 90 Days 400.96 Lbs. Milk 7931.3 Lbs.
Butter 120 Days 529 Lbs. Milk 10424 Lbs.

The above records are strictly official. She is a daughter of our herd sire, KING MEAD OF RIVERSIDE, who is transmitting with great certainty

HEAVY PRODUCTION - HIGH TEST - GOOD TYPE

There is no surer or quicker way of breeding these qualities into your herd than by the use of one of his sons from one of our high record cows. All of the daughters of King Mead of Riverside that have been tested for the year have an average of 4 per cent fat, and five two-year-old daughters have an average of over 700 pounds butter and over 14,000 pounds milk. We are offering several of his sons that carry more than 50 per cent of the blood of Aaggie Acme of Riverside 2d.

Pedigrees and prices will be submitted by request.

Good Bulls

We now offer two grandsons of King of the Pontiacs and one grandson of Rag Apple Korndyke, two of the greatest transmitting sires of the Holstein-Friesian breed. The dams of these three bulls are among the very best cows in our herd, and their present records should be increased at next freshening.

The three bulls we offer are as follows:

No. 1.—KING PONTIAC PIETERTJE BEAUTY. Born April 16, 1916. Sire: KING PONTIAC MUSA NETHERLAND 89775, whose sire is King of the Pontiacs. His three nearest sires have 440 A.R.O. daughters, 180 A.R.O. sons, and 238 producing daughters, a record not exceeded by any other bull. Dam: MAY BLOSSOM OF MILLBRAE 212662. Official records as a senior 3-year-old, 606.1 pounds milk and 24.95 pounds butter in 7 days, 2387.1 pounds milk and 98.76 pounds butter in 30 days. She is a daughter of a 30.88-pound cow and has a 31.86-pound 4-year-old sister. This is a nice typey calf.

No. 2.—KING PONTIAC NETHERLAND BARRILOS. Born March 18, 1915. Sire: KING PONTIAC MUSA NETHERLAND 89775. (Same as No. 1). Dam: SLEEPY BARRILOS OF MILLBRAE 161752. Official records 678.4 pounds milk and 30.88 pounds butter in 7 days, 2923.2 pounds milk and 122.56 pounds butter in 30 days. A wonderful producing cow who has a 31.86-pound 4-year-old daughter and a 24.95-pound 3-year-old daughter. Bull is a good individual.

No. 3.—RAG APPLE CLOTHILDE KORNDYKE 2ND. Born March 12, 1916. Sire: RAG APPLE CLOTHILDE KORNDYKE 105151, a son of Sir Rag Apple Korndyke, who is out of a 36-pound daughter of Pontiac Korndyke. Dam: GLADYS OF MILLBRAE 214830. As a senior 4-year-old she made official records of 729.4 pounds milk and 29.35 pounds butter in 7 days, 3064.1 pounds milk and 121.12 pounds butter in 30 days. As a senior 3-year-old she made 509.7 pounds milk and 21.07 pounds butter in 7 days, and 249 days from calving made 285.1 pounds milk and 13.64 pounds butter in 7 days. This is a very typey youngster and fit to head any pure bred herd. His dam is one of our best prospects, and is almost sure to increase her record

Come and see these bulls or write for prices and pedigrees.

Bulls from high record dams for sale at all times.

MILLBRAE DAIRY

PROPERTY OF

The Mills Estate, Inc. Millbrae, Cal.

Smith; one bred gilt to Mr. Laymen; one to W. V. Bennett; to Rev. C. R. Hedges and John McMartin a granddaughter of King's Col. out of a line bred Golden Model sow; one sow to W. H. Otterson; one Berkshire sow bred to Rival's Champion to A. Pilko.

A. A. Jenkins reports recent sales of two registered Jerseys to R. H. Brittingham, one Jersey bull, a son of Gertie's Son's Victor, to James Vincent, an Oregon breeder; one Jersey bull, a son of Gertie's Lad, to G. S. Look of San Luis Obispo County. Mr. Jenkins says he also made a sale of a fine Duroc-Jersey boar to Mr. Look and, of course, this through a Cultivator ad.

Mr. A. B. Spooner Jr., president of the San Luis Obispo County Dairymen's Association, recently returned from Wisconsin where he spent a month traveling over various parts of the state examining animals that were for sale. He finally made his selections at Oconomowoc, Watertown and Juneau. The carload consisted of 11 bulls ranging in age from eight to 14 months and 15 heifers, 13 of which were with calf to good A.R.O. bulls. The heifers were all from A.R.O. dams. Six of the bulls were purchased at Pabst Stock Farm. Two were sired by King Pontiac Champion and out of 20-pound dams. One was sired by Hillvale Paul Ormsby and out of Hillvale Lucile Ormsby, an exceptionally well bred heifer. She carries 50 per cent the same blood as the former 30-day butter champion, Pietertje Maid Ormsby, and 50 per cent the same blood as the sire of Duchess Skylark Ormsby whose record is 1506 pounds butter.

Two of the bulls were sired by Maplecrest King De Kol and another by Korndyke Segis Johanna, whose two nearest dams have an average of 39.05 pounds of butter in seven days. Two heifers purchased were sired by a son of Johanna McKinley Segis. Mr. Spooner has a son of Prince Gelsche Walker, purchased a year ago from Morris & Son, which he will use on the three heifers which he purchased. The following men purchased animals: Joseph Dalessi, C. S. Pike, Karl Steiner, James McMillan, John Walters, Joe Barlogio, H. M. Warden, Otto Sinsheimer, Manuel Garcia, M. D. Tognazzini, Valerio Tognazzini, A. B. Spooner & Sons, W. D. Wimmer, Peter Tognazzini, George Ross.

Harry L. Murphy will arrive this week from Eastern points with a bunch of Scotch heifers and bulls.

J. K. Fraser reports sales of Duroc-Jerseys; two gilts to J. Stith, a boar to C. A. Copren, a sow and boar to E. W. Beebe, a boar to Spreckels Sugar Company, a sow to E. J. Roux, Nevada. Mr. Fraser has also sold a registered Holstein bull to Francis Fiorini.

Peters, Lamson & Walker of Fontana and Devore have recently imported what they consider the best sow ever brought into California. She is the Golden Model bred sow, Model Lady 4th, bred by Waltmeyer Brothers of Iowa. She showed second at the Iowa State Fair this year to the grand champion sow of Iowa and the National Swine Show. This sow's litter mate topped Waltmeyer's sale last year at $450. They have also just received a sow from the herd of Hanks & Bishop, bred to the thousand-pound boar, Pathfinder. Sows in the Hanks & Bishop sale last month averaged $268. This makes the fourth sow received by Peters, Lamson & Walker lately, they being bred to the greatest boars in the East, namely Great Wonder, grand champion Iowa 1916, Pathfinder, King the Col., and Critic B.

A. L. Tubbs Co., Calistoga, reports sale of 15 bred large Yorkshire sows to J. R. N. Boyd of St. Helena.

Jay Dutter, manager of the Henderson Company, writes announcing the enlistment of two more enthusiastic boosters of Holstein cattle; A. A. Quackenbush and A. R. Strother of Acampo, who have just purchased of the Henderson Company a splendid young bull sired by the promising herd sire, Supreme Glista Pietje, whose dam, Glista Eglantine, has a record of 32.39 pounds butter in seven days, and whose grandsire on the dam's side, Prince Ybma Spofford 6th, has the greatest percentage of 30-pound daughters of any bull that ever lived, all of which are owned by Cornell University except one.

The Stanford Ranch at Vina during 1916 ran 39 cows on seven-day official test. Twenty-five out of the 39 made over 20 pounds of butter. The best record was that of Lauremaka, a senior four-year-old 518.6 pounds milk and 32.298 pounds butter. Eight cows are now on semi-official yearly test and G. W. Wendt, superintendent of the dairy department, says that it is the plan to eventually give every cow in the herd a yearly test. The herd of 429 head is headed by four bulls, Dutch Colantha Sir Ormsby, King of the Pontiacs 14th, Segis De Kol Pontiac Burke, Geneseo Lad. No females will be sold from the ranch until the milking herd numbers 200. Recent bull sales have been made to Geo. Hulseman, M. Muchada, Clara K. Morse.

W. H. Hammond of Butte County has recently sold five registered Shorthorn bulls to Guy Kennedy.

Raise Your Calves on

Blatchford's Calf Meal

and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.

Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 8 Waukegan, Ill.

ANOTHER RECORD

McAlister & Sons reports:

"K. P. Baby Walker, a heifer calving at the age of 23 months and one day in the McAlister herd of Holsteins, has just broken the state record not only for yearlings for seven days, but also surpasses the best mark yet made by any junior two-year old. She made 23.17 pounds butter in seven days and 85.49 pounds in 30 days, which are both world's records for any heifer calving at a like age. She milked 69 pounds of milk in 24 hours and 468.1 pounds in seven days, which are also unequaled by any heifer in the world at like age. She is the highest record yearling daughter of King of the Pontiacs, the greatest sire of the breed, and her dam is a 24 pound daughter of a 28 pound cow.

There are only five heifers in the state that have made over 22 pounds of butter under the age of 30 months, yet three of these have made their records in the McAlister herd in the last three months. Out of the last 11 heifers to freshen in that herd six have made over 21 pounds of butter with first calf, while two others have made over 20 pounds, the other three two-year olds making 19.86, 18.51 and 17.62 pounds of butter. Nine of the last thirteen cows with second calf or over made from 26 to over 31 pounds of butter, while the other four made from 20 to over 25 pounds."

K. P. Baby Walker

PROFITABLE HORSES

The exports of horses and mules have at last passed the million mark. The official figures given by the department of foreign and domestic commerce show that during the 27 months ending December 1, 1916, 1,029,961 head of horses and mules, valued at a total of $216,941,912, were actually exported from the United States, most of these going directly to the European war territory. Purchases are still continuing at a heavy rate.

The farmer who has been obliged to sell his horses at $115 per head, while his neighbors, using the same kind of mares, but who bred to Percheron stallions, have sold their surplus at prices ranging from $140, $165 up to $225 per head, sees in a financial way the direct contrast in the value of light horses as compared with the value of horses carrying one-half or three-quarters of Percheron blood. This has done more to increase the demand for Percheron stallions than anything that has occurred in the past 15 years.

In the judgment of the most experienced market men fully 75 per cent of the horses sold abroad for artillery and transport work have been grade Percherons produced by crossing Percheron stallions on the common light mares in this country.

Despite all contention to the contrary, the horse is a most important factor in contributing to the success of civilized nations, whether that success be sought for in peace or war, and it should be our effort in America to produce the most efficient power unit that can possibly be produced in horse flesh, to the end that our own farm and city work may be more economically and satisfactorily accomplished and the income accruing from the sale of our surplus horses to foreign nations be materially increased.—Wayne Dinsmore, Secretary Percheron Society of America.

PASTEURIZING OR STERILIZING BUTTER

Mr. Albert Levy of Hemet writes regarding his method of pasteurizing butter. The day after churning he places butter, after rinsing in three waters, in stew kettle which is set in pan of boiling water on the fire. As butter melts he stirs, watching that it does not become transparent. Then butter is taken from the stove and allowed to harden. It is then moulded.

Mr. Levy advises that 95 degrees of heat will pasteurize butter, 120 degrees will clarify and after such a degree of heat it will keep for 18 months.

There is little expense connected with a dairy test association aside from the salary of the man who does the testing. To cover this expense, each member is assessed a certain amount, usually based upon the number of cows he has to be tested. In some associations the amount is one dollar a cow per year and in others it is a dollar and a half. If a man milks less than ten cows he is usually required to pay for ten.

Every practical feeder knows that foods which are relished are likely to be consumed in abundance. This is especially true in the case of hay and fodders. A great saving may be made by curing and storing our feeding crops in such condition that they will be most palatable and digestible. If not palatable, they will not be eaten, and if not digestible they will produce no good results.

JOHN DEERE IMPLEMENTS

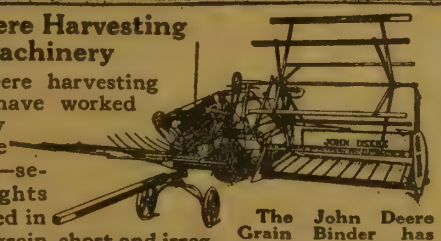
BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-111.

JOHN DEERE, MOLINE, ILL.

John Deere Harvesting Machinery



John Deere harvesting machines have worked under every possible condition—severe droughts that resulted in much light grain, short and irregular straw—extremely wet seasons, heavy grain, down and tangled.

However, the John Deere, "The Better Binder", has throughout maintained an unbroken record of success in cutting, binding and tying grain.

The John Deere Grain Binder has wide and high bull wheel—great power.

Main frame riveted—unusually strong.

Three packers instead of two, make better shaped bundles and save grain.

Accurate tying mechanism.

Quick turn tongue truck saves time, relieves horses and makes square corners and full swaths possible.

The John Deere-Dain System Rake

Here is what you do with the Dain System Rake:

Follow the mower closely, rake while leaves are still active and place hay upon clean stubble.

Make straight windrows, and no dumping of rake is required. There is no bunching of hay in turning corners.

Put the hay in medium size windrows, with the bulk of the leaves inside and the majority of stems outside.

The windrows will be loose in the center for the free circulation of air. The hay retains its color and nutrition.

The John Deere-Dain System is the rake employed with the Dain System of Air-Curing Hay.

Reel raised or lowered, rake thrown in or out of gear and angle of teeth changed by means of convenient levers.

Ample capacity. The inclined frame grows higher where the windrow becomes larger—an exclusive Dain feature.

John Deere Plows for Light Tractors

So far as quality of John Deere Plows for Light Tractors is concerned, they are built for the farmer who realizes that it is business judgment to buy a high grade tractor plow. Don't forget that a tractor plow is not an everyday purchase.

John Deere Plows for Light Tractors are noted for their high grade work in the field—the real test of tractor plow value.

Before you make your purchase, be sure to see John Deere Plows for Light Tractors. A careful purchase means a permanent saving.

The John Deere Light Tractor Disc Plow works with any standard tractor—the hitch is adjustable.

Three or four discs.

Discs have a double setting. Taking care of all conditions where a disc plow can be expected to operate.

Adjustable scrapers keep discs clean and lighten the draft.

No choking in trashy ground—frame is high, beams are dropped, which gives good clearance under the frame, and there is plenty of room between the discs for trash to pass through.

John Deere Factories

Every implement bearing the John Deere trade mark is made in a John Deere factory.

To insure the best in every class of implements there is a special John Deere factory for making each class. John Deere Plows are made in a plow factory; their hay-tools in a hay-tool factory; their planters in a planter factory.

Every tool in the John Deere line is made in a factory organized and equipped to make such tools.

All John Deere factories are in communication with each other. Each has the benefit and experience of all.

When it comes to purchasing raw material, John Deere factories as a unit, represent an enormous buying power. This is an advantage to purchasers of John Deere implements.

Don't forget that each John Deere factory is a leader in its field—that every implement it turns out is worthy of the name, "John Deere."

JOHN DEERE, MOLINE, ILLINOIS

SPRING IS HERE

O my dear, the world today
  Is more lovely than a dream!
Magic hints from far away
  Haunt the woodland, while the stream
Murmurs in his rocky bed
Things that never can be said.

Starry dogwood is in flower,
  Gleaming through the mystic woods
It is beauty's perfect hour
  In the wild spring solitudes.
Now the orchards in full blow
Shed their petals white as snow.

All the air is honey-sweet
  With the lilacs white and red,
Where the blossoming branches meet
  In an arbor overhead.
And the laden cherry trees
Murmur with the hum of bees.

All the earth is fairy green,
  And the sunlight filmy gold,
Full of ecstasies unseen,
  Full of mysteries untold.
Who would not be out-of-door
Now the spring is here once more!

—Bliss Carman.

THE MEAT THAT GOES FARTHEST

Written for California Cultivator
By Mrs. W. M. Taylor, San Bernardino

MEAT like every thing else has advanced so much in price in the last few months that we who once enjoyed porterhouse and sirloin must be content with something else. To do entirely without meat is not the proper thing, for young as old need to be supplied with this nourishing food, and I doubt if one saves in the long run at the present price of vegetables.

I have found that there are a great many cheaper cuts of meat that can be made very palatable. True, it may take a little more time in preparing, a little more care in selecting. If possible buy your own meat. We have a right to see and be pleased with what we pay for. No woman would think of going into a dry goods store, accepting the first pattern of dress goods shown her, then why should we do so with meat?

Our family standby now, when everything is so high, is brisket boiling meat. To you who have never used it the name may not sound very promising, but I have tested it over and over and am sure that it is the cheapest and best tasting meat for the money. Five or six pounds will supply meat (and various dishes) for three days, if managed right. This meat four months ago was selling for ten cents per pound; today it is 14 cents. Five pounds will cost 70 cents. Do not buy less than that, for the same fuel will cook five or six pounds as easily as two or three and besides you will get a better piece of meat. Do not get one too lean, (for therein lies the secret). One member of my family has often said he did not care so much for the meat as the trimmings, in other words, dressings, gravy, dumplings, or any of the various dishes made from meat. Well, one can not make these without a nice fat piece of meat. I wash my meat very carefully, pour plenty of boiling water over it and boil slowly but constantly. Continue to cook like this for several hours. Salt when partly cooked. If you need to add more water be sure it is boiling. Do not let the water boil away; you should have at least three pints when your meat is cooked. When the meat is perfectly tender lift it from the broth and place in a hot frying pan and place in oven until it is a nice rich brown. Put your kettle, which contains the broth, away; that is to be used later. You will find that your meat resembles a roast, the heat from the oven will bring enough fat from the meat to make a delicious gravy by using brown flour. This, with your meat, mashed potatoes, some kind of a salad and simple desert makes a very nice meal for the first day. We do not have meat three times a day. The children carry their lunches to school, so at the noon hour we only have a light lunch, so as to have the substantial meal in the evening when we can all enjoy it together.

When you serve this meat it isn't entirely necessary to say to your family, "Now, this is the very cheapest meat that I could buy." Use a little tact and let your family think once in a while that they are eating a roast, for even people of limited means like to think they're having the best sometimes.

Now for the second day you will find that when the broth which the meat was cooked in is cold, all the fat rises to the top and can be easily taken off. Use this fat for seasoning dressing, or it is nice to add boiling water to it and boil drop dumplings in it or noodles on busy days. I find a nice substitute for noodles in macaroni. Cook this until tender and serve plain, or it is nice with a good tomato sauce. After you have taken the fat off you have a clear stock left, and this makes a foundation for vegetable soup. You can see at a glance that this will furnish material for another nice meal; vegetable soup first, and one of the dishes I have already mentioned, with some of the meat sliced cold and a different vegetable from what you had the evening before.

For the last and third day you can guess, perhaps. Yes, hash. Some do not like it, that is true, but I think it is very nice. I cut the scraps of meat up with one large onion, brown together and add some cold potatoes, and just before serving add a cup of hot cream. But you do not need to use the scraps this way; a very nice meat pie may be made instead. Only add a little flour and milk to it so that it will not be too dry, and bake in rich biscuit dough.

I do not see how any one could get any meat that could possibly go farther than that.

We are also very fond of meat loaf, and especially is it nice for Sunday dinner, for what is left is so nice and handy to slice cold for supper or to use for lunches on Monday morning, which is usually a busy day. I get three pounds of Hamburger and one pound of pork sausage. This will cost 60 cents. Mix all together, and this will make a nice loaf by adding two or three eggs, eight soda crackers, enough cream or milk to make it moist enough to mould; season as you like; bake slowly for one and a half hours.

Again, the round steak is not to be despised. I often purchase 20 cents worth, pound it well, flour and cut in small pieces and fry in suet fat until

Ask about the Ro-San Washstand—Hot and Cold Running Water Without Plumbing

it is brown on both sides. Add one pint of boiling water and steam until it is tender, or about 30 minutes. Have a large baking dish hot, slip meat and gravy into it and place it in the oven while you prepare the following.: 2½ cups of flour, two heaping teaspoons baking powder, pinch of salt and enough water to make a stiff batter. Put this in spoonfuls over your meat and bake 20 minutes and you will have a dish that all the family will enjoy. By using the baking dish you do not disturb your baked dumplings and besides it looks much nicer. Garnish this with parsley, give it some fancy name, forget it only cost 20 cents and enjoy it. This served with creamed potatoes, green peas or cauliflower is especially nice. These three kinds of meat I use more than any other at the present time and find they cost according to their food value.

MEETING H. C. OF L.

Written for California Cultivator
By L. E. B.

WITH a family of growing children whose appetites are increasing in size, with a salary which does not increase, and the H. C. of L, I find with others that the problem of balancing rations is rather a task of juggling with the proper foods, to keep up growth and health, and costs which for some foods are almost prohibitive. Having our own milk and eggs has been a wonderful help, and my problem has been to supplement these in the most economical way.

Albacore

I discovered a brand of canned fish labeled Albacore, which is the dark meat and being in small bits does not cost so much. I get two cans for 25 cents and find the following an excellent meat dish at little cost: One can albacore, two eggs beaten, two cups milk, two bread crumbs, salt and pepper to season; mix well and pack in greased pan or mold, cover tightly and steam for one hour This can be baked, but I find steaming makes a lighter and better meat loaf.

Beef Heart

I find a beef heart to be an economical meat, but the usual ways of cooking did not appeal to us, so I tried putting it through my meat chopper and making a meat loaf. I cut the heart in four or five pieces and boil in enough water to cover for half an hour and then chop it and proceed as for Hamburger loaf, adding bread crumbs enough to absorb the broth.

Today I got two loaves of bread from the bakery for five cents as it was too hard and dry to sell at the regular price. Half I used to make a bread pudding and the rest I cut in strips and toasted to serve with a cream soup. The increased cost of flour has made even home made bread high in price, so I tried one of the cheaper grades of flour. The result is cheaper bread, and though it does not look so fine and white it is light and just as nutritious as that from the higher priced flour.

RABBIT CHEAP AND GOOD

Written for California Cultivator By
Clara E. Remington.

THE solution to the problem of economical meat, is found, I consider, in raising a few rabbits.

There are many ways of cooking rabbit, and I suppose there is none more popular than frying. But the age when they can be fried passes so quickly while the period of roasting and stewing is unlimited. Our favorite way of cooking it is en casserole.

After it has been disjointed, washed and dried, salt each part and roll it in flour; then fry in casserole or any baking dish or pan. Have cut up one or two onions, carrots and a bell pepper, if in season, which fry and place with meat. Make a thin gravy of the fryings and cover contents of casserole. Cover the dish and bake until meat is tender. If a stew is preferred, simply pour water instead of gravy over the meat and simmer.

A rabbit pot roast too is delicious. Any of these methods of cooking rabbit can be used to excellent advantage with chicken too old to fry.

MY STAND-BY CUT OF MEAT

Written for California Cultivator
By Eva M. Snedaker, Pomona

MY standby cut of meat. Take three pounds of shoulder, cut wash and drain. Put three tablespoons of shortening in meat-roaster or any dish that can be closely covered. When hot add six tablespoons of flour and stir until a dark brown; slowly add water to make a smooth thick gravy. Add salt and also rub salt on the meat. Put the meat into this gravy, cover closely and set on back of stove or in the oven where it will cook slowly; never hurry it.

I like to put it on Saturday while I am doing my baking. Then it will have hours to cook without keeping a fire for it. Sunday, a few minutes warming and meat and gravy are ready for dinner.

We like heel-meat cooked in this way, and it is a fine way to cook rabbit or a tough old rooster.

SEA FOODS.

Written for California Cultivator By
Caroline M. True, Lancaster

CURED meats used to be the every day standby of the rural housewife, but now that they have been promoted to the luxury class it behooves us to look elsewhere. Those of us who live near the old Pacific with its teeming millions of inhabitants have one supply of meat that even the war can not materially affect.

Fish is rich in protein and more easily digested than other forms of meat. Those who are out of reach of the fresh fish markets can always fall back on the canned product. The following are some palatable recipes for canned fish:

Creamed Salmon

Cut the entire top from the can and remove without breaking up the contents. Place in a baking dish in the oven to heat through while you are preparing the following dressing: To one heaping tablespoon of butter melted in a skillet add one tablespoon of flour. When thoroughly mixed stir in two cups of milk. As soon as it thickens add one beaten egg and salt and pepper to taste.

Arrange your salmon carefully on a platter. Cover with the dressing, garnish with slices of hard boiled egg and your salmon has become a delicious and dainty dish.

Salmon Loaf

Remove the bones from a can of salmon and add two cups of bread crumbs dissolved in milk. Stir in two well beaten eggs, salt and pepper to taste and place in a well greased individual bread pan to bake for one-half hour in a hot oven. Slice and serve with the same sauce used in creamed salmon or serve as cold sliced meat for luncheon.

Tuna Salad

Smooth to a paste one well beaten egg, one teaspoon mustard, one tablespoon flour. Thin with one-half cup cider vinegar. Place on the stove and add one tablespoon sugar, one tablespoon butter and salt and pepper to taste, and one cup boiling water. Stir constantly until it thickens. When cold mix with a can of tuna and serve with crisp lettuce leaves. No chicken salad could be better.

PRIZE WINNERS

In the March prize contest the first prize goes to Mrs. W. M. Taylor of San Bernardino; second to "L. E. B." Others are so excellent that we wish there were more prizes to award. All others published this week and in later issues will entitle senders to three months' extension of subscription.

April Contest

Announcement of April contest will be made next week.

The chicken coop doesn't look as good as a garage in the back yard, but it's a darn sight more profitable.

KING
EIGHT

SEVEN PASSENGER TOURING
$1585

Low cost of operation and upkeep, coupled with high power and reliability, have made the King a favorite car among Farmers

THIS Company has found that Farmers want all the style, finish, comfort, and luxury required by the city man, but are interested in those qualities *only* after a car's mechanical superiority has been proved.

The KING chassis for 1917 is substantially the same as the one which earned this Pioneer Eight a reputation for efficiency, power and economy all over America and in fifty-two foreign lands. It was this chassis which made the famous sixteen KING stock car road tests last year, adding many notable chapters to automobile annals.

This remarkable mechanism embodies a practical experience possessed by few manufacturers and represents the eight cylinder V-type motor at the point of its highest development. It is the most economical car for its power now being offered and is built to endure the hardest service for many years.

Sixty horse-power, Model EE may be had in four luxurious body models; Touring, Foursome or Roadster, $1585; Sedan, $2150. Prices F.O.B. Detroit. There is a KING dealer in your vicinity. Write for descriptive matter today and let us tell you where to find him when you are ready.

All prices quoted may be advanced at any time

A Living on a Back Lot

Written for California Cultivator By Jean A. Koethen

CAN a man make a living on a back lot with poultry? This question has been answered in the negative a good many times, but every now and then some man with more enterprise than others rises up and disproves all that the wiseacres have said. John Hollway of Glendale is one of these enterprising persons, and his back-yard poultry plant is an example of what common sense and indefatigable industry can accomplish.

The lot on which this plant is located is a little larger than the ordinary city lot. The entire lot, including residence, lawn and poultry yards, is 75 x 300 feet. Taking out about 50 feet for house and lawn there is left a space about 75 x 250 feet, on which Mr. Hollway keeps year in and year out between 600 and 700 adult fowls, to say nothing of the thousands of youngsters which are hatched every spring.

To provide accommodations for so many fowls in such small space requires careful planning, for every inch must be utilized. That each pen and house may be reached with the fewest possible steps and the least waste of ground in passageways, an alley is run straight through the middle of the place. This alley goes directly through the feed and incubator house, connecting with the brooder house and one large laying pen before it reaches the house and then passes at the rear each of the 20 or more breeding pens. Nests and mash hoppers are arranged along the alley so that the care of the birds may be simplified as much as possible.

Mr. Hollway gave up his business in the city seven years ago and came to Glendale to rest. Idleness soon proved irksome. Friends said, "Do try keeping a few chickens", and he tried, first for amusement, afterward, as he came to realize the possibilities of "a little place well tilled," for what there was in it. The dozen or two hens was gradually increased. To the sale of eggs was added the sale of baby chicks, of broilers and of breeding stock. Different breeds were added as there was demand for them, till now five varieties are kept: S. C. White Leghorns, White Minorcas, Rhode Island Reds, Barred Rocks and Anconas. Last year 600 baby chicks were sold and about 1000 broilers, while hundreds of orders were filled for hatching eggs. Mr. Hollway plans to raise 500 hens each year for replenishing his own stock, and in order to do this he must raise about 1000 chicks to broiler age. To make room for these new hens, 250 of the older hens are sold off each summer.

The most interesting building on any poultry plant is the brooder house. Mr. Hollway's has the south front which every well regulated brooder house must have, with windows along the floor, and is divided by full height partitions into four compartments, each large enough for 100 chicks. The brooders are of the hot water type, the water being heated by a small gas stove, and the temperature in both brooder and play room is kept so high that the chicks are perfectly comfortable wherever they are. The simple device of raising the window a few inches gives the chicks access to their sunny outside run, and after the first few days, except on chilly days, they may be seen running in and out, cooling off in the yard, then running back into the play room or, if they are chilled, to the brooder for warmth.

The first 24 hours after hatching the chicks get nothing but the dry sand which covers the floor of the brooder house. They pick at this and thus get something into their crops ready for grinding the first meal. The second morning they are given their first meal, commercial chick feed scattered over the sand. The same day a hopper of dry laying mash, the same that is fed to the hens, is set before them. Mr. Hollway has no time for concocting fancy dishes. Believing that warmth is the first need of baby chicks he gives them abundant warmth, grit, charcoal and fresh water, a daily feed of greens, dry mash and chick feed in hoppers and feeders, always accessible, a feeding of dry bread crumbs now and then for dessert, only this and nothing more. Bread and egg, cottage cheese, clabbered milk, breakfast foods, are for those who have time to coddle their chicks. They are not necessary, and these simply reared chicks, with warmth, sunshine, green feed, exercise, and always simple food at hand prove by their thrifty appearance that chickens, like children, will "eat what is set before them and be thankful" when they must.

When they are four or five weeks old the chicks are removed from the brooder and placed in the cold brooders in a yard adjoining the brooder yards. These cold brooders are simply boxes with glass fronts. Each box is divided into four compartments, holding 25 chicks. "We don't like to keep them in larger flocks", said Mrs. Hollway, "because they are so apt to pile up and kill one another." They remain in these cold brooders several weeks until they are ready to roost.

To keep so many hens in such close quarters requires absolute cleanliness. Every water fountain is rinsed every day—this is one of Mrs. Hollway's tasks — dropping-boards must be scraped and yards swept almost every day. Every minute Mr. Hollway can spare from attending to the wants of his customers and minding the incubators, every hour Mrs. Hollway can spare from housework and the care of the baby chicks, must be spent in cleaning. Lazy people would find this constant house cleaning irksome, but they enjoy it, for is not a clean, well-ordered poultry plant as much a thing of beauty in its way as a garden or a home in its way? Besides, the business gives them a good living. "We don't expect great things," said Mrs. Hollway, "but it gives the two of us a good, comfortable, living. Last year we cleared a thousand dollars. This year we shall not do quite so well because of the price of feed, but we shall hold on and do the best we can".

The presence of several cases of typhoid fever in Santa Ana has called attention to advice of physicians to drink no water from the irrigation canals unless it has been boiled.

Your Eggs
Do They Pay Dividends?
They would if you hatched them in a MODEL INCUBATOR and raised the chicks under a Model Hover. These machines are guaranteed result-getters.

"THE AMERICAN"

BLASTING
Saved this Orchard

"The use of Farm Powders in the orchard industry is rapidly being learned and appreciated," writes E. H. Shepard, editor of *Better Fruit*. "The worst looking orchard I ever saw, suffering from lack of drainage, was blasted two or three years ago and now looks as fine as any well-kept orchard in the Hood River Valley." By blasting the soil of your orchard with either of the

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

you can insure better drainage, save fertilizer, and keep your trees in heavy bearing. By planting in blasted holes you can make your new trees grow faster, bear earlier, and yield better, bigger crops.

Using just *any* dynamite for soil blasting is like taking medicine in the dark. Get Eureka Stumping Powder, one of the Giant Farm Powders. It has a slow, disruptive, heaving, far-reaching effect, entirely different from the quick, shattering, cutting, localized action of most powders and dynamites. Its use in your soil will prove profitable, because it does the work right.

Five Books FREE

Now—before you lay this down—write us to send you our book, "Better Orchard Tillage." It contains information that is worth many dollars to you. Other books—on Stump Blasting, Boulder Blasting, Ditch Blasting and Subsoil Blasting for farm crops—also free on request. Mark and mail the coupon.

Danger

Safety

"Armco" Iron Corrugated Culverts Make Dangerous Places SAFE!

Following the example of the railroads, highway builders are abolishing bridges wherever possible and substituting the safety, economy and convenience that is possible with

"ARMCO" IRON CORRUGATED CULVERTS

Never "closed to traffic", never put "out of commission" by floods or storms, never in danger of breaking down beneath heavy tractors or motor trucks, never requiring repairs, or painting, "Armco" Iron Culverts eliminate all the objectionable features of bridges and make travel safe and sure.

"Armco" Iron's remarkable rust-resistance results from its *purity* and *evenness*. It endures for years and years without one cent of cost for maintenance. The "Armco" Trade-Mark on every section is evidence that your taxes are being wisely applied.

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing and Formed Products, write the manufacturer in your vicinity, or

Oakland Sensible Six

The Practical Car for You

Up any hills—over any roads—the *Oakland Sensible Six*—$875—will take you with ease, comfort and economy.

It's a big car, though it weighs but 2150 pounds, and its long, semi-elliptic springs—51 inches in rear—over-size tires, (32x4), long wheelbase, (112 inches), all give the *Sensible Six* that easy riding quality which wins the enthusiastic praise of owners everywhere.

The valve-in-head motor develops 41 h. p. at 2500 r. p. m.—one horse power for every 53 pounds of car weight. On the hills or in bad going the *Sensible Six* has more actual power and more proportionate power than any other car of its weight.

This power with light weight means fuel and tire economy. Average drivers get from 18 to 25 miles per gallon, and from 8,000 to 12,000 miles per set of tires.

Oakland Eight—$1585—is built for those who need a big, luxurious 7-passenger eight cylinder car of maximum pull and speed.

Our new book "How to Buy your Car Intelligently" will prove helpful to you no matter what car you buy. Write for it to-day—it's free. (54)

Vol. XLVIII No. 14 LOS ANGELES: April 7, 1917 One Dollar Yearly

Deciduous Fruit Prospects

More Reports from all Sections of the State. Some Sections, Because of Frost, Indicate Lower Production Than Estimated Last Week. As a Whole, More Hopeful Outlook Because of Vigorous Second Bloom. More Definite Information Shortly

IT is wonderful the amount of bloom which the apricot is persisting in showing this year. After one crop has been injured so that it drops the fruit buds continue to come and even yet there is much bloom coming in many sections. But as to apricots, there have been many discouraging reports. However, let us not be too discouraged, and it is possible we may yet get one-half or three-fourths of a crop. In any case futures are up. Offers have been made around 12½ cents, and some have even maintained that a 15-cent price on dry 'cots is possible. Prunes are hanging around six cents, peaches seven, or better. Demand will plainly be great. Let every grower be true to the organizations which are working to the end that all that is possible shall be secured for the grower. There should be no effort at combining and holding up prices beyond reason. In fact, that is impossible with farmers constituted as they are, but every grower should keep control of his own fruit through his own association rather than permit it to get into hands which will use it to batter down prices later in the season.

Continuing the reports of last week:

J. B. Neff, Anaheim, Orange County

The very small acreage of deciduous fruits in this locality neither swells nor diminishes totals. There is no frost damage noticeable here.

I have just returned from Santa Barbara and made some injury in Ventura County as to crop prospects. There has been considerable frost damage in places while others only a mile or two away have escaped. The general opinion seems to be that only about 30 per cent of a normal (apricot) crop will be gathered. A few orchards on the Castaic which had never suffered from frost are a total loss.

Early blooming varieties of peaches have had some damage but not so great as the apricots.

H. M. Armitage, Horticultural Commissioner, San Diego County

As to condition of deciduous crops in San Diego County, I have the following to offer: Apricots, 10 per cent; almonds, 90 per cent; cherries, 100 per cent; peaches, 100 per cent; prunes, 100 per cent.

Aside from peaches none of these crops are of commercial importance except as they relate to the local market. There is strong promise, however, that before many years San Diego County will be a strong competitor in other of these fruits.

The apricots were severely hit by the frost, as were also a few of the almonds. Otherwise the season has been very favorable for heavy deciduous fruit crops.

Wm. Gould, Horticultural Commissioner, Yolo County

I can report at the present time that there is a good prospect for a 50 to 75 per cent crop of almonds in Yolo County. Apricots will go about 60 per cent of a full crop. Too early to say as to cherries. Peaches look like a 100 per cent crop now. Most too early to say as to prunes, but if the blossoms count for much there will be a 100 per cent crop. The rain did some damage to the almonds and apricots.

There was a large planting of prunes and seedless grapes in this County this year.

Harry M. Foss, Horticultural Commissioner, Modoc County

Too early for any information as we still have winter weather here.

Dudley Moulton, Horticultural Commissioner, San Francisco County

As you know this county is not a producing but a marketing county. We have only about 2000 acres given over to truck gardening, with no orchards at all. I do think we will play an important part if the new standardization bill passes. My action in placing frozen oranges under quarantine when they arrived in San Francisco, and of sending many to the crematory to prove that we meant what we said when we advised growers not to send frozen oranges into San Francisco, had a direct and positive influence in helping growers to take more care in grading their fruits. We expect to see that the standardization of fruits is maintained here if this new bill goes into effect.

A. Everett, Moorpark, Ventura County

The apricot crop in this vicinity will be above the average. I would estimate it at 110 per cent average.

The frosts of about three weeks ago killed most of the early settings, but other bloom came on most of the trees, which is setting well.

Peaches, prunes and other deciduous fruits are not raised here in commercial quantities. The few trees growing here promise good crops. The early growth on walnuts was nipped by the frost and will likely cut the yield considerably as the blossoms come largely from this growth.

C. G. Marchus, San Pasqual, San Diego County

Apricots were badly frosted March 16. Can not tell how much of a crop is left. A neighbor reports total loss in young orchard. Local paper reports almost total loss from freezes of March 16. It goes without saying that our prospects in this valley for a fine crop of cots is much less since March 16th.

D. C. Funk, Upland, San Bernardino County

It looks now as if we would have a big crop of both apricots and peaches.

Wm. B. Jackson, Ontario, San Bernardino County

There will be a full crop of 'cots and peaches if there is no late frost or any bad weather conditions. Trees are full of bloom.

A. L. Rutherford, Horticultural Commissioner, Stanislaus County

Apricots, half crop, killed by frost the 15th; almonds, full crop; cherries, full crop, just blooming; peaches and prunes, full crop.

Leonard Coates Nursery Co., Morgan Hill, Santa Clara County

Apricots, one-fourth crop; almonds, half crop; cherries, peaches and prunes look good.

State Dairy Cow Competition

The University Announces Results from Which We Quote as to Cows Which Produced Over 40 Pounds of Butter Fat During the Month of January

IN the following report the name of the owner is given first, then a list of the cows with the performance. The abbreviations Gr., Ay., G., H., J. stand for grade, Ayrshire, Guernsey, Holstein and Jersey.

The first figures after the name of the cow indicate age (or where age is not given it is indicated by dash). For instance "Riverside Beauty 2d, H. 7-8" means that animal is a Holstein aged 7 years and 8 months. The next figure (55) indicates number of days in milk at beginning of the month, the next number (1806.1) production of milk in pounds for the month, and the last two numbers, percentage of fat (3.52) and pounds of fat (63.575) for the month.

Abbott, K. W.: Riverside Beauty 2d, H., 7-8, 55, 1806.1, 3.52, 63.575; Charlotte, Gr. H., —, 23, 1510.9, 3.33, 50.313; Melba, Gr. H., —, 58, 1304.0, 3.83, 49.943; Rilla, Gr. H., —, 110, 1494.7, 3.25, 48.578; Pet, Gr. H., —, 38, 1359.0, 3.52, 47.837; Ella, Gr. H., —, 105, 1194.2, 3.81, 45.499; Della, Gr. H., —, 8, 1368.3, 3.29, 45.017; Gretchen, Gr. H., —, 9, 1227.0, 3.60, 44.172; Illa, Gr. H., 3-11, 21, 1022.0, 4.27, 43.639; Emeline, Gr. H., 4-4, 85, 1303.7, 3.25, 42.370; Rose, Gr. H., —, 112, 1031.9, 4.00, 41.276.

Beebe, Floyd; Rosie, Gr. H., 11, 95, 1237.6, 4.1, 50.736; Brownie, Gr. H., 3-2, 61, 1195.6, 3.8, 45.444; Olga Petrova, Gr. H., 3, 35, 1142.4, 3.9, 44.548.

Bohnett Bros.: Murne, Gr. G., 5, 49, 1122.9, 5.63, 63.219; Flossy, Gr. J., 9, 23, 1181.9, 4.53, 53.540; Spot, Gr. J.-H., 5, 87, 989.1, 5.25, 51.928; Reddie, Gr. S., 7, 38, 1189.8, 4.10, 48.782; Fayne, Gr. J.-H., 6, 54, 1146.9, 3.97, 45.532; Dorris, Gr. H., 7, 151, 1045.3, 4.33, 45.261.

COW TESTING ASSOCIATIONS

SOME rmarkable lessons are being taught by the state dairy cow competition, report of which for February is given on this page. Even more remarkable are the lessons being shown to members of cow testing associations. There are today more in the state than ever before and they are being formed every day. Hundreds of worthless cows have gone to the block and more should. To encourage this movement the California Cultivator offers three prizes of $100 each to members of cow testing associations whose herds show the highest average during the entire 12 months of the competition. Several entries have already been made. More may be made between now and May 1, at which time the entries positively close. Join now.

Write Prof. F. W. Woll, University Farm, Davis, for entry blanks.

The OILPULL burns the fuel that is cheapest for you to get

"It is remarkable," said a prominent OilPull owner the other day, "how flexible the Rumely tractor is on the fuel proposition."

This man uses "stove tops" in his OilPull—it's easy to get and the cheapest fuel oil he can buy.

The point we emphasize is that the same ***high degree of efficiency*** is possible whether it is cheaper for you to buy low test stove oil, distillate or kerosene, and our ***written guarantee*** holds good on whatever of these fuels you use.

Other OilPull advantages that Coast owners appreciate are strong, sturdy construction, and protection to all parts, which mean ***low cost of upkeep.*** The air intake extends high up out of the dust.

Oil cooling does away with need of hauling water and prevents the radiator from freezing. A pre-heater and self-starter are recent added features of importance to the prospective tractor owner.

As a threshing engine the OilPull is unequalled, because of its close regulation. The power the OilPull furnishes is smooth and steady regardless of the load—the speed of the engine is ***automatically*** and ***instantaneously*** adjusted to meet every change in the load.

For all around work, draw-bar or belt, money can buy no better value than the OilPull. Two sizes—15-30 and 30-60 horsepower.

Ask our nearest branch for special OilPull catalog.

ADVANCE-RUMELY THRESHER CO.
LA PORTE (*Incorporated*) INDIANA

Address our nearest branch

RUMELY OILPULL TRACTOR

Guarantee

We guarantee the OILPULL tractor to operate successfully *at all loads and under all conditions*, not only on all grades of kerosene permitted by law to be sold in the United States and Canada, but on distillates and fuel oils free from earthy matter.

There's Only One OilPull—Rumely, LaPorte

Salt Method of Curing Olives

Written for California Cultivator By George C. Roeding

RELATIVE to the salt method of curing olives, it is not necessary to know just how much salt is used, because all that must be done is to take a barrel, bore a hole about an inch in diameter and close to the bottom, have the other end open, then place a layer of salt a couple of inches thick, then a layer of olives three inches, alternating the salt and olives until the barrel is about three quarters to seven-eighths full. Every two or three days pour from two to three gallons of water over the olives and allow it to run out through the bottom rather slowly. Within a month the olives will begin to shrivel. After this period the olives on the top should be placed on the bottom and the salt more or less intermingled through them and pour water over them about every five days. It is very easy to determine when the olives are cured because practically all of the bitterness will be extracted from them. After the bitterness is practically out of the olives, their flavor may be very materially improved by pouring a little olive oil into a vessel of any kind and filling it full of olives. The surface of the fruit will become covered with a thin film of oil. If it is desired to keep the olives for a year or more, a small sprinkling of salt on them is all that is necessary.

During my travels in Asia Minor and in Greece I noticed a number of these olives in barrels. The barrel was usually tilted and there was a small quantity of brine in it. The olives were usually above the brine. How often they changed the brine or whether it was changed at all I am not in a position to say. I thought I had some definite notes on this subject but fail to find them. However, as soon as the war is over with I can get full particulars from my friends there without any trouble.

The olives treated in this way are those which the peasant class use so much when taking their noonday meals in the field.

Marketing Culls

Touching upon marketing methods and the duties of the county horticultural commissioner, Commissioner Dudley Moulton of San Francisco County, in an address given before the last State Fruit Growers' Convention, refers to methods of some orange handlers as follows:

"In one instance I found three men associated together who were bringing cull oranges and lemons from Southern California. One of their number remained in the South and bought his fruit while the others opened a store in San Francisco, graded, wrapped, and packed their oranges and lemons, and sold them to a cheap trade, mostly street peddlers. They bought culls only, which were infested for the most part with red and purple scales. They had in some way procured a lot of "Sunkist" wrappers from some exchange packing house in the South and had gathered together many used "Sunkist" boxes, and they were putting up a "Sunkist" brand out of their larger sizes of culls. I notified these traders that future shipments which were infested with scale insects would be returned to whereever they came from. As they themselves were the buyers and shippers their business stopped at once. I called the use of the "Sunkist" wrappers to the attention of Mr. King, who represents the exchange in San Francisco, and he stopped their use. Now after a lapse of several months I again find these men bringing in more cull oranges and lemons and I feel that it will be necessary to take more drastic action to stop this kind of business. The better class of merchants do not want cull fruits offered for sale in the market."

Keeping Out the Pests

Frederick Maskew, chief quarantine officer, has submitted his report for the month of February to Commissioner Hecke. The report covers imports received at San Diego, Los Angeles, San Francisco, and Eureka stations and possesses matter of vital interest. Inspection is made of ships, passengers' luggage and every service which might act as a carrier.

Ninety-six per cent of the horticultural imports were passed as free from pests; three per cent was accepted after proper fumigation and less than one per cent destroyed. These consignments caused the inspection of 119 ships during the month and the number of parcels inspected was 263,667.

The above figures will convey an idea of the magnitude of the work involved in the protection of the interests of the fruit industry of California and something of the multiplicity of duties assumed by the commissioner of horticulture.

China, Japan, Hawaii, San Domingo, Tahiti, Mexico and other points are numbered in the foreign countries to import. Florida, Illinois, Ohio, Oregon, Texas, Washington and Pennsylvania are numbered among the tates.

Among the fruits intercepted because of pests were sweet potatoes from China, pineapples from Hawaii, oranges and bamboos from Japan.

P. S. C.

CONDENSED

Rosin Spray

is not a liquid

P. S. C. Rosin Spray contains Rosin, Fish Oil and Caustic. Easily dissolved—no boiling required. Will kill all varieties of scale on fruit trees. Nothing better known for Mealy Bug, Woolly Aphis, Black Peach Aphis and plant lice. One pound will make 2½ gallons of spray, full strength as specified by the Horticultural Commission of Los Angeles County.

Put up in following sizes:

1-lb. tin 25c, 2-lb. tin 40c, 4-lb. tin 75c. 40-lb. tin $4.00.

Prices in bulk on application.

Nurserymen save time and money by using P. S. C. Rosin Spray for dipping nursery stock. For sale at the best seed stores and nurseries. If your dealer cannot supply you we will ship direct on receipt of price.

Pacific Soap Company, Inc. 5800 Central Ave. LOS ANGELES

Guatemala Avocado Nursery

E. E. KNIGHT, Yorba Linda, California

Bulletin No. 77, U. S. Dept. Agriculture

"The avocados of Guatemala form a distinct group * * and from a commercial standpoint, the most promising for introduction into our tropical possessions. The Thick-skinned round and Thick-skinned oval are probably the most promising owing to the thick skin, good keeping qualities and fine flavor."

Write for booklet or call.

ranges and lemons from Tahiti, weet potatoes from Mexico, potatoes nd apples from Washington and ther products from other states.

The report is interesting and carries ith it a very good knowledge of im-ort conditions of the country, so far s these conditions apply to the fruit ndustry and the growers.

CITRUS FRUIT IMPROVEMENT

A. D. Shamel of Riverside is the uthor of "Citrus Fruit Improvement, low to Secure and Use Tree Perform-nce Records," Farmers Bulletin 794, . S. D. A. It is the latest in fruit nprovement. From the summary we uote:

"Many California citrus growers eported in recent years that they ere securing lower yields of fruit per cre than in the earlier history of eir industry. Complaint also has een made that an increasing propor-ion of the fruit of the leading com-ercial varieties of oranges and mons was abnormal or 'off type' in ze, form, color, smoothness of skin, r other important characteristics.

"Systematic and continued investi-ation of this subject in the groves California since 1909 has disclosed at a considerable proportion of the eterioration observed is traceable unintentional propagation of unde-irable strains of the leading varieties sulting from bud variation.

"The results obtained in bud-selec-on experiments carried on during the ast five years indicate that by top-orking with buds from those having onsistently good records for produc-veness and quality the inferior or drone" trees of such varieties as Washington Navel and Valencia ranges can be made productive and rofitable.

This bulletin describes the meth-ds that have been found effective nd practicable in locating the desir-ble and undesirable trees in groves nd for transforming the latter when ound."

CITRUS CANKER

We do not want citrus canker in California, and this for financial rea-ons, as is shown by the following tatement by Commissioner Hecke in he last number of The Monthly Bul-etin.

"Cost of Controlling Citrus Canker—Upon an inquiry by the state commis-ioner of horticulture directed to the hief of the bureau of plant industry, United States department of agricul-ure, to ascertain the cost of the at-empted control of citrus canker in Florida, Assistant Chief Kellerman vired:

"'Federal appropriation for citrus anker, 1915, $35,000; 1916, $550,000; Florida legislature, $195,000; Florida itrus interests, $100,000; estimated otal cost this year, $600,000.'

"This means that the initial cost f attempted control in 1915 was 35,000, and in 1916 a total of $845,-00, divided as follows: Federal gov-rnment, $550,000; Florida legislature, 195,000; citrus interests, $100,000. The cost for 1917 is estimated at $600,-00.

"It is not necessary to use superla-ive language to impress upon us the ecessity of maintaining the most areful watch in the citrus districts f California. For fear that in spite f our strict quarantine order, en-orced by diligent inspection, some in-ested fruit or plant might slip hrough the quarantine in the bag-gage of transcontinental travelers and start citrus canker in California, sus-picious infestations of a bacterial nature should be immediately reported to the state commissioner of horti-culture."

Thompson Seedless Grapes

Written for California Cultivator

FOR the growing of Thompson Seedless grapes a rich deep soil is necessary in order to get the best results. Soils which are shallow or those underlaid by hardpan are not to be recommended. A rich loamy soil is likely to give the best resuts. Before planting the grape vines the soil should be well prepared, that is to say, it should be plowed deeply, if possible at least 15 inches or more, and noxious weeds, such as morning glory, Johnson grass, etc., should be eradicated before the grape vines are planted. This can be done by continuous summer cultivation, cultivating at least once in ten days and thus keeping the weeds from reaching the surface of the ground.

Before planting the vineyard should be laid out with the greatest care. If it is a heavy rich soil the vines should be planted farther apart than in a sandy light soil, but for Thompson Seedless under ordinary conditions, the avenues or rows should be at least 12 feet apart and the grape vines in the row at least eight feet apart if not more.

In order to get the best results with this variety of grapes they should be trellised, and if it is intended to dry the grapes in the vineyard it would be best to run the rows from the east to the west in order to be able to expose the grapes on trays as much as possible to the sun, whereas if the rows run from north to south this would be more or less impossible.

The grape vines which are to be planted in the vineyard may be procured from a nurseryman or, as has very often been done, may be raised by the farmer himself. It is perhaps not advisable to plant any unrooted cuttings, for a good many cuttings when planted in the field will not make roots on account of the fact that they cannot get the best of care as they would in the nursery. On the other hand, if the cuttings are planted for one year in the nursery and rooted there, we have the chance to discard all undesirable stock and plant only the very best.

The planting should be done as

Tizit

Let Us Tell You About

TIZIT SPRAY

Tizit

Wonderful Results Attested by Many Prominent Citrus Fruit Growers who SPRAYED INTO BLOOM

TIZIT is a thoroughly tested tree spray made in California, a combined fungicide and insecticide designed after many years' experimenting by experts to meet the conditions that confront the Western Coast citrus fruit grower.

J. D. Enyart of Kaspare Cohn Ranch, Montebello, says "My orchard last spring was very bad with black scale, and I felt confident would not set a crop in that condition. I sprayed immediately with TIZIT. The trees were then in full bloom, with the result that the smutty mold fungus was destroyed, the trees cleaned very perceptibly and a splendid crop of fruit set. I unhesitatingly recommend spraying into the bloom with TIZIT for crop setting. Later on as the scale hatched it died and at present writing (March 8, 1917) our trees are commercially clean."

We claim for TIZIT;

—that it will eliminate the necessity of fumigation;

—that it will clean trees of moss and lichen, leaving trees and fruit perfectly clean;

—that trees sprayed with TIZIT have proven immune to red spider;

—that it is the cheapest and most efficient spray you can use;

—that as a SPRAY INTO THE BLOOM to prevent fruit dropping it has no equal.

Teague Quality Citrus Trees

will all your citrus wants appease

R. M. Teague Citrus Nurseries

R. M. TEAGUE, Manager

San Dimas, California

APRIL is an ideal month in which to plant orange and lemon, pomelo and lime trees. The advent of warm weather as the rainy season draws to a close, renders the soil ideal for tree growth. Ideal conditions call for ideal trees, which are the only kind we have to offer, hence are anxious to serve you. Correspondence a pleasure; a telephone message a joy; and a personal interview a delight.

What are Pedigreed Trees? We want You to Reason Before You Buy Citrus Trees.

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries.—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertilizer, labor, investment tied up in land—these are the big factors that go to pot if, years after the trees are planted, the grove bears miscellaneous offspring.

POTATOES

9 4-5 Bushels from One Pound of Seed

Three potatoes, planted in 56 hills in Huron Co., Ohio, yielded this amount. The seed, the planting, and the crop harvested are matters of county record. You can do as well or even better by following my instructions. It is not a matter of variety of seed, or soil, or fertilizer used, important as each of these matters is, but it is the selection and cutting of seed and treatment. It was these elements that enabled me to produce the yield of 552 lbs. of potatoes from one pound of seed. Full information as to how it was done, the seed used, the soil, the fertilizer employed, the tillage and the methods of producing this large crop will be sent for One Dollar. Send your order now and grow more potatoes from less seed. Any one who feels too poor to spend a dollar to learn how to increase the yield in raising potatoes send me your name and address. Planting time is near. Send your order today and raise more potatoes from less seed.

A. R. Gibson, Brookfield, Ill.

early as possible, that is to say, not later than the middle of March, providing the soil conditions permit of doing so. If the soil is light and sandy there is no reason why the planting should not be done in January if the weather conditions are right. On the other hand, where we have a heavy adobe soil we may have to wait until very late.

In planting the grape vines the roots should be pruned, that is to say, if they are bruised or otherwise injured they should be cut back into the healthy portion, and the soil around the roots should be made firm. All shoots are removed except one, and this one is cut back to two good buds, and in order to protect the young grape vine there is no reason why a half inch or inch of soil should not be placed on the top of the plant. In districts where we have the phylloxera it is well to plant resistant grape vines only. These grape vines can be procured of a nurseryman and should be planted with the greatest care. In planting phylloxera resistant vines we should endeavor to plant the union, that is to say, the place where the stock and scion are united, about one inch above the surface of the ground, and afterwards cover up the whole grape vine in order to protect it from drying out the first two or three months.

The California Prune and Apricot Growers

A DECISIVE forward step in the organization of the prune and apricot growers of the state was taken early in February of this year when the 24 members of the board of trustees were elected and a twenty-fifth member appointed by the state market director.

To hold this election it was necessary that at least $500,000 in stock be subscribed. Previous to the date set for the election there was needed something over $75,000 to make up the total. This amount was subscribed at a great mass meeting of growers in San Jose on January 13. Then followed the election of trustees, completed about a month later, and the election of the board of directors and officials of the organization. The executive heads of the association command the universal confidence of the growers and stand high in their respective communities.

T. S. Montgomery, president of the organization, is a well known resident of San Jose, who has proved his worth in every undertaking with which he has been connected. For 40 years Mr. Montgomery was one of the largest realty operators in the Santa Clara Valley; is now president of the Garden City Bank & Trust Company, and a fruit grower in addition.

H. G. Coykendall, chosen for general manager, has for 25 years grown and packed prunes and apricots in the Santa Clara Valley and is known as one of the biggest operators on the coast. The past season his firm handled one-fourth the prune crop of Santa Clara County and one-eighth the crop of the state. His knowledge of marketing conditions is broad, and he combines all the qualities that go into the making of the high type of executive. Mr. Coykendall was responsible for the cleaning up of the stock of the old Cured Fruit Association at 2¼ cents when the association was willing to close out at 1¾ cents and has in many ways contributed to the prosperity of the growers.

For vice president, Mr. W. A. Yerxa, of Princeton, Colusa County, was selected. Mr. Yerxa has had a very broad business experience and for many years has been a prominent grower of the Sacramento Valley. During the past two years he has planted 250 acres of prunes in addition to his other holdings.

Jos. H. Bone, secretary-treasurer of the association, is a well known figure to nearly every grower in the state. As secretary of the Growers' Information Bureau his work brought him in contact with many growers, and through the efforts of the bureau under his direction, growers in Santa Clara County saved from one half to a million dollars on last year's crop. It was largely due to his efforts that the present organization was undertaken. Mr. Bone has a 40-acre apricot and prune orchard near San Jose and is familiar with the problems that beset the grower. He has held high positions with some of the largest firms in the country and is now a member of the board of state market commissioners.

Organizing the Prune and Apricot Men

H. G. Coykendall, general manager California Prune and Apricot Growers', a busy man perfecting arrangements for handling the coming year's prune and apricot crops. The prune men have had some severe lessons in dealing with interests which were not looking after the growers' welfare. Unfortunately, the grower has also had cooperative experience not entirely satisfactory, but the growers as a rule are clear headed and see that if permanent success is to come to the prune industry they must stand together. We believe Mr. Coykendall should be encouraged and given a fair trial in this movement.

Organization Faces But One Grave Danger

While the association was incorporated February 23, 1917, with $505,000 subscribed of the total capital of $2,500,000, 75 per cent of the total prune and apricot acreage of the state and $750,000 in stock must be subscribed by May 1, 1917.

At present over 4000 growers have signed up and the acreage is well over the 60 per cent mark.

The organization is certain of completion except for the danger of too

An advertiser in the Cultivator means an advertiser whom we know to be reliable.

any growers contracting their crop o outsiders at prices abnormally hign. With the crop yet unknown, such rices as are now being offered to ome growers will undoubtedly prove mpting. But growers should remem- er that with an unknown crop these rices may even go higher if they ome in and make the organization ecure. Should prices go up, as seems robable if the association is fully ompleted, growers who contract now ill lose the difference. If prices go own, much of the fruit already con- acted for may be rejected. Crop ontrol means price control, and it rowers come into the association, ndering it secure, they are certain get the highest price individually, t in scattered instances.

The directors elected are: For dis- ict 1, W. A. Yerxa, Princeton, Colu- County; district 2, H. C. Dunlap, ountville, Napa County; district 3, rank A. Brush, Santa Rosa, and G. C. lexander, Healdsburg, Sonoma Coun- ; district 4, T. S. Montgomery, San ose, H. G. Coykendall, Cupertino, J. . Hayes, San Jose, W. G. Alexander, an Jose, A. CROP REPORTS

Continued from Page 399

alph D. Robertson, Farm Adviser, San Joaquin County

Some few weeks ago the fruit grow- s were rather worried over the num- rous frosts, but I find that most grow- rs now think that little damage has esulted, and prospects are bright for good crop.

eo. Marchbank, Horticultural Commissioner, Madera County

Apricots, 20 per cent; almonds, 100 er cent; peaches, 100 per cent; runes not out enough to tell but no amage so far.

. W. Waite, Horticultural Commissioner, Imperial County

It looks like full crop of apricots, ut too early to make any estimate.

E. Hassler, Horticultural Commissioner, El Dorado County

In regard to the coming fruit crop will say it is too early yet to make a reasonably correct estimate as our main fruit crops, plums and pears, are just getting ready to burst into bloom. Indications promise a normal crop of these fruits. Peaches have been hurt a little by last week's frost, but not enough to affect the crop, probably save some thinning.

There will be a large acreage of potatoes planted here this spring. Growers have ordered about 100 tons of commercial fertilizer for this purpose.

G. C. Kreutzer, Farm Adviser, Kern County

Apricots, not more than 15 per cent; almonds, about 25 per cent; cherries, too early to say, not many grown; peaches, 35 per cent; prunes, have not given much attention, perhaps 35 per cent.

W. H. Volck, Horticultural Commissioner, Santa Cruz County

Present indications are for a 75 per cent crop of apricots. Cherries, peaches and prunes are blooming well and look like a full crop.

It is yet too early to give an estimate of the fruit crop in this county, but everything looks well at present. The frost did no material damage to apricot, and unless late spring rains cause "rain rot" there will be a full crop in most orchards. The quality of the apricot crop may be somewhat impaired by smut, as young black scale are very abundant in most of the orchards.

Cherries are blooming well, but that is true every year. The crop depends on weather conditions from now on.

Apples have budded out well with extra strong fruit buds and promise a heavy set.

M. Sharpe, Vacaville, Solano County

Regarding fruit prospects in Vaca Valley and vicinity to date I will say that they were never better, although most varieties are in the blooming stage. Apricots are good in some orchards and light in others, but will average a fair crop. They suffered somewhat from wind and cold weather during the blooming period although they bloomed heavily.

Pears will probably be the lightest crop we have, possibly due to the enormous crop of last year.

No almonds grown to mention in Vaca Valley, but reports from near at hand indicate a light crop.

Cherries, plums, peaches and prunes are blooming 100 per cent. The weather during the blooming season of the last named varieties has been ideal.

Fred P. Roullard, Horticultural Commissioner, Fresno County

It is rather early to get any idea regarding what sort of a setting the fruit is now making. All of the blossoms are not out on some of our peach trees. Apricots and almonds have been somewhat seriously injured by frost, to what extent I am unable to say. The peaches appear to be setting well and there seems to be plenty of bloom, so unless unfavorable conditions arise in the future I see no reason why we should not get a normal crop.

Geo. A. Lamiman, Horticultural Commissioner, Shasta County

It is almost a guess as to what crops will be, but I would estimate apricots at five per cent; almonds, 50; cherries, 100; peaches, 90; prunes, 100. The weather is so "finicky" that it cannot be depended on. We do not grow either apricots or almonds in commercial quantities. Up to the present the conditions for all our other fruits are good; apples, pears, prunes, peaches, grapes, etc. We are shy on rainfall, so the moisture conditions are not what they should be. Not much orchard cultivation has been done so far. Cover crops are decidedly short. Poor weather for vegetables and garden making of all kinds.

Chas. F. Collins, Horticultural Commissioner, Tulare County

My report to you on crop conditions and prospects here on March 21 was ancient history in less than 24 hours, as it does not at all describe the conditions at present. The night of the 21st certainly did things to us here. All through what is known as the Delta section, in the vicinity of Visalia, Farmersville and Exeter, apricots, cherries and quinces were practically destroyed. Some plums seem to be injured somewhat but I do not

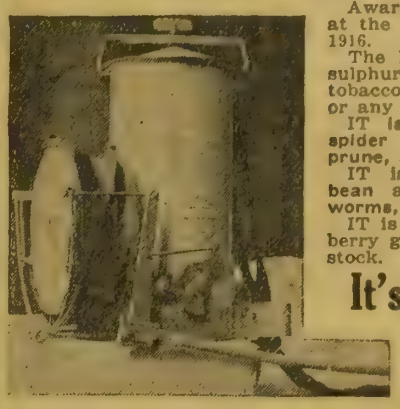
A Word to the Wise

grape-grower, gardener and orchardist

If insects, rust, mildew and blight eat up your crop profits, you need

The American Beauty Dust Sprayer

"A Puff in Time Saves the Vine."



Awarded the BLUE RIBBON and DIPLOMA at the 10th Annual District Fair, Fresno, Cal., 1916.

The latest and best machine for the use of sulphur, Paris green, lead-arsenate, hellebore, tobacco-dust, lime, lime and sulphur mixture, or any other dust spray.

IT is sure death to grape-mildew, or red spider and mite on vines and trees—grape, prune, almond, etc.

IT is a boon to vegetable growers—kills bean and asparagus rust and mildew, also worms, beetles, red spider, etc., on truck crops.

IT is invaluable to cotton, tobacco and cranberry growers, and for nursery and greenhouse stock.

It's Fast---It's Thorough

Has steady feed, continuous action, extra fine screen. Will cover almost double the acreage of any other machine in same time, and with same amount of material, because dust it throws is more finely divided. Positively will not choke or clog. It is light and strong, easy to carry and easy to work.

Don't lose valuable time tinkering with a poor machine. A few hours lost at a critical time may cost you your crop.

For sale by all progressive dealers. If your dealer does not carry it, send us $11.00 for the vineyard size, or $13.50 for the orchard size machine, and we will send you an AMERICAN BEAUTY DUST SPRAYER, all charges paid. Try it a week. If it is not entirely satisfactory, return it at our expense, and we will cheerfully refund your money.

Vegetable Planting Calendar for April

Northern California

Written for California Cultivator By A. R. Gould

THE welcome rains experienced during March have been of the greatest value and saved much work with the sprinklers. As we are not generally fortunate enough to get much rain from now on, the use of the hoe and cultivator between the crops must be the general rule, and all the time put in now in this way will result in better and more crops. Other timely advice is to keep the garden well filled with every useful vegetable. This will in a measure meet the high cost of living and save money.

Peas

You may still make a sowing of late peas, and for this purpose sow Melting Sugar variety, an edible pod which is cooked like string beans. To bring this crop to maturity keep well watered and cultivated.

Cabbage, Broccoli and Kale

If these have not yet been planted out in prepared ground do this without delay and water each plant after being set out and until well established.

Carrots

Make successional sowings of the varieties mentioned in our previous notes and see that this crop is frequently hoed or cultivated between the rows.

Turnips

Sow Early Snowball for succession and use plenty of water on this crop so that it will mature quickly. Sow thinly and thin out to at least eight or nine inches apart. A dusting of soot between the rows will prove beneficial.

Lettuce

Make successional sowings of Big Boston, May King and White Paris Cos. Do not let this crop suffer for want of water.

Radish

Sow again the varieties mentioned in our former notes.

Tomatoes

Plant out sturdy plants of Victoria Whole Salad, Trophy Earliana and San Jose Canner. They should be placed quite four feet apart each way. Water well after planting and until well established, but after this stage it is only necessary to draw the soil up around the roots to conserve the moisture. They can then take care of themselves.

Beans

This is the month to plant the bean crop on a large or small scale, and for a dry situation we recommend the Tepary variety, a small white bean which is a heavy yielder and is destined to become very popular. Other good varieties for a general situation are: Davis White Wax, Refugee or 1,000 to 1, Stringless Green Pod, Black Valentine (noted for its resistance to blight), Golden Wax. These comprise the bush types. Among the pole varieties we would recommend any of the following: Kentucky Wonder, Challenger, very early and prolific, King of the Garden, a very popular and fine main crop variety, Scarlet Runner. Sow the bush varieties one pound to 100-foot row and for a row of the pole variety the same length use eight ounces of seed. Continual cultivation between the rows is necessary to secure good crops of beans. We do not advise growing Lima beans in Northern California as they only ripen successfully in the counties of the lower part of the state.

Potatoes

Plant the varieties mentioned last month in well prepared ground which should have been highly manured. Plant in trenches one foot deep, placing the tubers 15 inches apart in rows which should be three feet apart. See that the tuber is free from disease and plant eyes up.

Corn

This is the month to plant corn, but leave it until the last two weeks. The following varieties are to be recommended: Country Gentleman, Early Mammoth, Crosby's Early, Golden Cream, Golden Bantam. Sow two feet apart in rows.

Cucumbers and Melons

Prepare hills, well manured, placed four feet apart each way, and sow the seed about the end of the month. The best cucumbers are White Spine, Long Green and Everbearing. The best melons are Rocky Ford, Gold Lined, Burrell's Gem, Acme, Hackensack, Golden Beauty Casaba and Honey Dew. Water melons should be sown in May, when we shall then deal with them.

Southern California

Written for California Cultivator By D. F. Reichard

APRIL is a month of great activity about the garden. The weather is warming up, which means all vegetation should be making rapid growth. To make quick growth moisture is necessary. If the soil has not been handled properly or it does not naturally hold moisture irrigation will have to be resorted to. Irrigate, don't sprinkle. Make wide furrows between the rows of stuff and allow the water to flow very slowly so that it soaks in very thoroughly. When the ground is in proper condition work it up as deep as possible without disturbing the roots of the small plants. Above all things keep the weeds down; they drink more water and take up more good plant food than one would realize.

During April make a new planting of most of the hardier vegetables for succession and put in any and all of the more tender varieties, as well as set out pepper, tomato, eggplant, sweet potato and the like.

In the matter of fertilizers, if you are working with new soil that has not been heavily cropped use fertilizers strong in nitrogen, such as blood meal, and phosphoric acid, such as bone meal. For soils that have been heavily cropped potash should also be used; this may be obtained from ashes. California soils in general may be considered new soils as yet, so there is still a considerable quantity of potash in our soils. Animal manures are excellent fertilizers.

POTATOES IN CALIFORNIA

Potato planters should write at once to the University of California, Berkeley, and ask for Circular 161, "Potatoes in California", by J. W. Gilmore. It gives an outline of the entire practice of potato planting and harvesting.

Seasonal Gardening

Written for California Cultivator By Ernest Braunton

THE present season is a backward one and in April much gardening work may be done that would ordinarily fall in March. In my own garden the poppies sown in October are now just large enough to transplant. This is an easy task for they bear removal well, being from one to four inches high.

Some transplanting was made necessary by harsh weather of the past winter, not alone with poppies, but with many other plants known to be hardy. In confined beds on nearly level ground seeds in the lower spots rotted through continued cold weather accompanied with steady rains. This left poppies and other plants alone on high spots. In other cases frosts were so heavy that the little seedlings the sun's rays first struck in early morning could not stand the onslaught of such allies. In shaded spots, where the sun did not strike plants until the frost had melted from them, they were unharmed.

It is not too late to sow such seeds now, together with any or all of the following: balsam, cockscomb, marigold, nasturtium, phlox, portulaca, scabiosa, petunia, salpiglossis, and zinnia. All these are annuals but you may sow seeds of nearly all perennials too, for they will not flower unless conditions are favorable and if peculiar weather prevents they will resume their normal behavior next season, and as some of them do not flower the first season, little is lost. Bear in mind the sun is hot on tender growth now, and to stimulate youthful vigor, which may slump at midday, it is well to sprinkle very early in the morning so that every plant may drink its fill and be ready for long warm days that prove exhausting to foliage in soft, immature condition.

All lawn work may now be done, whether old or new, and all lawns will be active from now to cold weather of autumn, so do not neglect the watering. If you have not fertilized, there is no time in all the year when grass needs it more or will assimilate it so quickly. Personally I prefer March and April to any other months for feeding lawn grass. Unless you have stable manure in rotted condition and free from seeds of weeds it will prove cheaper and better to use a commercial mixture.

Insect pests hatch best when seeds most do germinate, therefore when assisting flower plants and fighting weeds, do not forget that all nature is very active and that insects of all sorts may menace your garden. See that all perennials that need division or transplanting receive attention at once, for they are just about to make their most vigorous growth. Not alone the hardy plants, but all the tropic and sub-tropic classes may be divided, replanted, or planted out in warm sunny locations where an abundance of water may be given. Keep cannas in a depression in the soil, or even plant in a pit, and after the growth is up a foot or two put stable manure to fill up to surface and keep heavily watered. You will then have cannas that all will admire.

Tropical Jungles

Now is the time to build for tropical effects. Choose palms or bananas for background, or both—the bananas in front of palms, or with clumps of Fatsia papyrifera, the rice-paper plant. In front of these put cannas, elephants' ears, papyrus, callas and any plants having large leaves or thick waxy texture. In nearly frostless spots these tropical jungles may be interesting and attractive permanent features, but even if made over or made up every spring they are worth while.

Lack of Variety

In spite of the fact that our climate encourages a very great range of plant life we do not grow the wealth or variety of herbaceous plants common in eastern gardens. A few years ago I sent to Philadelphia and secured a list of a dozen each of 36 perennial flowering plants, a special offer. Every sort grew well and no garden that I could find had as great variety of bedding plants and flowers. For this one reason alone the average Eastern garden is much more attractive during summer than are ours of California.

Planting Ornamentals in Northern California

Written for California Cultivator By A. R. Gould

THIS is the busy planting month for most of the annuals as most of them will be ready to be planted out some time during April and will require a great deal of attention at this stage.

Asters

If these were not sown last month sow the following varieties: Cregos Giant, lavender, rose, pink and white; also Semples Branching in the same colors. Later on you will find these invaluable for making solid beds of color.

Begonias — Tuberous and Fibrous Rooted

These should now be started and in a few weeks will be ready to place out in flowering quarters. We shall deal with these more fully next month. In the mean time have the ground well manured and dig in plenty of well rotted leaves in which they thrive.

Dahlias

These have become very popular of late and seed so readily and are so easily grown that there are now more varieties than names in the dictionary, and it is also suprising to see the number of amateurs who have suddenly become dahlia specialists. The aim seems to be to produce the largest, and quality and form, with color, has been thus sacrificed, to say nothing of usefulness, but we are inclined to think that the "monsters" will not last, and the smaller types such as the singles and Collarettes, which are more useful from a decorative point of view either in the home or in the garden, will find a lasting place with the general public. Seed sown now in a warm situation in sandy soil will provide plants which flower this year. Try a packet of singles and watch the colors develop later on.

Tubers should be examined and planted towards the end of the month. Plant four feet apart each way in well prepared ground.

The Southern Idaho Beekeeper's Association is building a warehouse at Caldwell.

DUNHAM CULTI-PACKER
TRADE MARK REG.

Makes a Fine, Firm Seed Bed

Chas. B. Wing, noted seed and alfalfa expert says, "Three tools—the plow, spring tooth harrow and the Culti-Packer are absolutely all that are needed to prepare a perfect seed bed."

The two rows of semi-steel wheels on the Culti-Packer cut and crush every lump to a depth of several inches. The back wheels come half way between the front, so no clods are missed.

The shape of the wheels allows them to cut down through the top soil and firm out all air spaces left by the turning of furrows. At the same time they leave the surface loose and well mulched so the seed bed does not dry out quickly.

Culti-Pack your seed beds this year—get the tool from your John Deere dealer.

FREE
"SOIL SENSE"

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Silage from Beets

Is it advisable to ensile mangels or other root crops?—Subscriber.

We think not. However, the question was referred to Prof. F. W. Woll and he answers:

"You are correct in stating that there is no advantage in placing beets and other root crops in a silo, and it cannot be done successfully unless the beets are cut up fine, which is slow work and will take considerable power. Under our California conditions the practice has less to commend it than anywhere else, as the root crops can be left in the field during the winter months until wanted for feeding. They can also be stored in a root cellar if preferred, and one or the other of these methods is greatly to be preferred to trying to make silage out of the roots.

Fattening Hogs

What is the best ration for fattening hogs which are now about 100 pounds in weight? I have a supply of ground rice and barley. In what proportion should these be fed and if not a balanced ration what other feed should be used to balance it? How long should it take to fatten such hogs?—Subscriber, Woodland.

This question was submitted to Prof. F. W. Woll of the University Farm, Davis, who answers:

"The value of rice and of the by-products obtained in the milling of rice under California conditions is not yet well established. The rice industry in our state is new and but little practical feeding experience has been accumulated so far with rice or rice feds. An experiment with rice versus barley for hogs is now being conducted at the university farm. While it is too early to say much about the results as yet, the indications are that barley will prove a better feed than whole or rolled rice when either feed is fed alone with a little tankage.

Better gains will doubtless be secured by feeding the grains mixed, say two-thirds barley and one-third rice, or equal proportions by weight, if the price is greatly in favor of the rice, as is likely to be the case. The mixed grains may be fed in a self-feeder and tankage placed before the pigs in another self-feeder.

Skim milk in amounts of less than six pounds per pound of grain will give excellent results, if available. Either of these feed mixtures will furnish a balanced ration for hogs and will secure maximum gains in weight. The time it will take to fatten the hogs will depend on various conditions besides the rations fed. Good thrifty pigs of our ordinary breeds ought to gain a pound per head daily during the fattening period of three to four months.

Crippled Chicks

I have a 200-egg incubator which gives me trouble in regulating. Have it in a room where temperature varies a great deal. Always have a lot of cripples. Instructions read: First five days, with eggs, 102; brown eggs, 103. Second five days, white eggs, 103; brown 103. Third five days, white eggs, 104; brown 103. Fourth five days, white eggs, 102; brown eggs 103. have never seen other instructions recommending so much heat. Would it be better to run it lower?—Subscriber, Fillmore.

Cripples always come from too high a temperature at or near hatching time. The fact that you have them in every hatch shows that you have let the heat go too high some time. When your thermometer reads 105 degrees it was very likely more than that in some part of the egg chamber, or if you set the thermostat for 105 the temperature may have run up higher some time when you were not watching. It is barely possible, too, that the thermometer is not absolutely correct. Get a druggist to test your thermometer and then keep your heat down to 104 degrees, no matter what the book says. The hatch may be a little slower in coming off, but you will have no cripples.—J. A. K.

Keeping Weevils Out of Beans

A subscriber at San Luis Obispo, who has tried it successfully, writes of his method of keeping weevils out of beans. He says: "I used eucalyptus leaves satisfactorily by placing them in a box with the beans. Please report your experience with them."

Beans

What is best variety of dried beans to plant in home garden? Does Lady Washington or Pink give larger yield? Does Tepary differ enough in flavor to plant for variety?

Please tell something of the life of wevil found in dried beans. It seems to be under the unbroken skin of bean. At what stage in growth of bean does it enter? Can it enter a dried bean in perfect condition? I know about fumigation with bisulphide of carbon when weevils are present but wish to know about their prevention. Are early or late plantings or different varieties more susceptible to the attack of weevils?

Should same ground be used immediately for second planting?—Subscriber, Pasadena.

For so far inland we would recommend either Pink, Blackeye or Tepary beans. Teparys are very similar in flavor to Small Whites, and we recommend this variety for your location.

There are two species of weevil; one attacking the bean and depositing its egg while the bean is in the blossom, the other which deposits its egg after the bean has matured. In either case the weevil develops and eats its way out during hot weather. The embryo of the weevil may be killed by fumigation as you suggest. Late plantings seem to be less susceptible to attacks from weevil. There is no reason why you should not put in a second planting on the same ground as soon as you could get it in shape after its first crop is cleaned up.—D. F. R.

Planting Tomatoes

Am going to plant tomatoes of San Jose Canners variety. How far apart should they be planted?—Subscriber, Hughson.

Depending on your soil and whether you intend to irrigate or not would make some difference in the distance to set the plants. If you expect to irrigate they could be set as close as five feet in rows, rows six feet apart but if you do not intend to irrigate would recommend setting plants 8 x 8 feet apart.

Corn Ear Worm

Please give best method of protecting sweet corn from worms. Some advise planting a few seeds early in the hope that the moths will exhaust their supply of eggs before the regular crop comes up. Others advise the lighting of a small torch at night to attract the moths. How should this be made?—Subscriber.

If the subscriber had given his name we would have been glad to mail copy of the Cultivator of October 7, 1915, which would have answered this question.

Cooperative Dairying

Will it be a workable plan for small dairymen in one section to establish a cooperative dairy, the dairy cows to be furnished by different members but the operation of the dairy to be carried on at one plant, or farm, the members to grow feed and deliver at the central plant, the management of cows and milkers to be absolutely under direction of one manager? The idea is that sanitation and operation under the state dairy law will be made more simple, with a possble economy of labor.—Subscriber, Gardena.

This question has been submitted in a general way to farmers, and as a rule the feeling is that such a cooperative effort will be confronted by so

any difficulties that its success ould be questionable. Cooperative arketing on the part of many dairy- en has proved a complete success. id it is possible this form of work ight, but considering the expense of livering feeds to one central plant, e worth of the stock furnished, id division of profits, if any, the atter would be so complicated that e doubt whether such an undertak- g would prove successful. In any se, purely from the business stand- oint, realty values in a section like ardena are so high that overhead ex- nse would be extremely heavy.

ooking Feed

I am purchasing a dairy feed con- ining bran and other concentrates, id to be a balanced ration. Is such feed improved by cooking?—Sub- riber, National City.

Woll's "Productive Feeding of Farm nimals" says: "The method of cook- g feed was at one time much prac- ced, especially among European rmers, but it has now been gen- ally abandoned, except in the case feeding swine." Numerous trials nducted at experiment stations have own that it does not, in general, pay cook feed for farm stock. There is certain advantage in cooking pota- es. Henry's "Feeds and Feeding" says: "No one can review the large accumulation of data from the experi- ment stations without being convinced that generally it does not pay to cook feed for farm stock when such feed will be satisfactorily consumed with- out cooking. However a few feeds such as the potato and the field bean of the North can be successfully fed to swine only after being cooked. Hard grains and seeds which cannot be ground should be cooked or soaked."

and you'll reap a rich harvest of crisp, luscious, succulent, nutritious vegetables—and cut your grocery bill down one-third to one-half.

Take no chances with doubtful seeds—plant Germain's proven seeds and you will obtain definite, certain results. Germain's seeds are specially adapted to California soil and climatic conditions.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Unsigned communications receive no attention.

Collecting Rent

A rents house and lot to B by the month. B with A's permission allows C to place small movable building and other effects on lot and charges C for taking care of them. B falls in arrears with rent and gives A an order on C for $24, B's arrears being $51. B, on notice from A, vacates the premises. If C comes to claim his building, etc., what course should A pursue to collect if possible the $51 arrears due by B? Can A by injunction or otherwise retain possession of building, etc., until the $51 is paid?—Subscriber.

The building placed on the property by C, if personal property, is subject to attachment on the order given A by B for $24. If it is not personal property, then it has become a fixture attached to the real property and cannot be moved. The other effects might, or might not, be subject to attachment, dependent upon what they were. C, of course, would not be liable for B's debts, but only that which he agreed to pay to B and for which A has an order from B.

Foreclosure

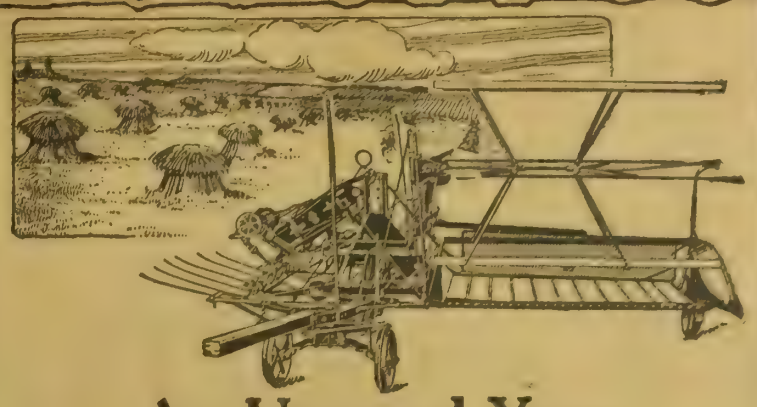
Having sold a tract of land and having taken a mortgage on same tract for almost the whole amount, and said tract having changed hands several times since without any payment having been made to me, what is the wisest course for me to take, to recover property or to get my money? How much would a foreclosure cost? The realty agent verbally promised to see that the payments were made, that he would take up the deal in the case the buyer failed to make the payments. Can I hold him to his promise?—Subscriber.

Apparently your only remedy is to bring foreclosure on your mortgage. The costs of foreclosure through to the date of sale would probably run in the neighborhood of $20 or $25, or more, exclusive of attorney's fees, which you would have to arrange with your attorney. You can, of course, procure a deficiency judgment against the mortgagor for any difference between the amount for which the property sells under the mortgage foreclosure and the amount of the mortgage, together with attorney's fees and costs. In view of the fact that the agent made a mere verbal promise he could not be held, as one cannot be held for debt, default, or miscarriage of another unless by agreement in writing, nor can one be held upon an agreement to purchase real property except by agreement in writing.

Debts of Lessee

I leased my ranch and lessee left owing a number of creditors. Now I have received a bill for work on my engine and pump and he wants me to pay the balance due for repairs. I had a contract with the lessee under which he was to keep up all repairs at his own expense. What can this man do? Can he put on a lien?—Subscriber.

Under the circumstances stated it is apparent that credit was extended solely to the lessee, nor was the engine or pump taken into the possession of the mechanic, and, even if so, it is now in your possession, and therefore such repairs merely to the engine and pump would not be entitled to a mechanic's lien nor to hold you for the value thereof. Under your contract with the lessee he alone is responsible for the repairs made, or to be made, in the ordinary upkeep of the engine.



An Unusual Year

THIS may be the last year you will have a chance to market your small grain at such high prices. Naturally, you will do everything you can to secure a good crop and to harvest every last grain of it. The size and quality of the crop may not be entirely under your control, but the harvest is yours to make or break. It depends almost entirely upon the binder you use.

If your binder is not in first-class condition, get genuine I H C repairs for it at once and put it in shape. If it is too far gone for that, buy a new **Champion, Deering, McCormick, Milwaukee, Osborne,** or **Plano** binder now, while deliveries can be made and the machines gotten ready for work before harvest time. See your local dealer early in the season and arrange with him to have your binder delivered in plenty of time to assure the complete harvesting of your crop.

The twine situation this year is complicated by a number of unusual features, but we are furnishing our customers with twine of as good quality as ever. Quality in twine is more important than price. At the same time, just as a matter of insurance, it will be wise to make your twine purchases as early as possible. The dealer will appreciate any aid you can give him by placing your orders for I H C repairs, twine, and harvesting machines at the earliest possible moment.

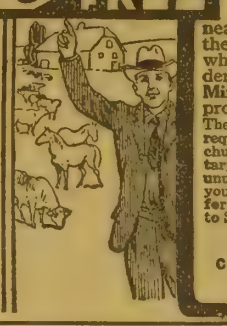
160 ACRE FARMS IN WESTERN CANADA FREE



Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from $15 to $20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get near $2 for wheat and raise 20 to 45 bushels to the acre he **is bound to make money**—that's what you can expect in Western Canada. Wonderful yields also of **Oats, Barley and Flax. Mixed Farming** in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

Cactus

THE writer is a subscriber to your valuable publication, and is interested in the article published on March 3, 1917, entitled, "Cactus for Feed." He does not claim to be an expert farmer, but the little experience which he has had in the growing and feeding of cactus may be of interest to some of your readers.

The land upon which the experiments have been made is about 26 miles back from the ocean and at an altitude of 2250 feet.

Three years ago 65 plants of forage cactus were planted in two different kinds of soil, a red soil and a black sandy loam soil. They grew well the first year. They were cultivated and irrigated. The result showed that they would stand the climatic conditions.

The second year 7,000 leaves were planted in May in rich dark soil. We commenced to cut from these plants about the first of September. A cooker was made, five feet long, three feet wide and 18 inches deep. The leaves were put in the cooker and chopped up with a spade, and different kinds of ground grain were mixed with the cactus and cooked. This cooked feed was fed to hogs, which ate it readily and grew and fattened on it. Small shoats would steal and eat the green leaves through the fence. An old gobbler would take four or five hens and go around a plant and stick his bill through the biggest leaf and then the others would join him and eat the leaf until it would drop off. Yearling calves got into the patch and not only ate the new leaves but commenced to eat the original plants, so it became necessary to fence the patch in order to save it.

The third year about eight more acres of forage cactus were planted in May, and from this additional eight acres, with the two acres already planted, over 100 tons of leaves were cut and fed. Feeding was commenced about the first of September when the pasture was poor. The cactus leaves were ground to a pulp, which dropped from the machine into a galvanized iron storage tank, and from there into a tank below, which is used for mixing. Into this cactus pulp cotton seed meal and barley meal and ground corn were mixed, and this mixture fed to the dairy cows and growing hogs.

Each dairy cow is fed daily about 60 pounds of ground cactus, two pounds of cotton seed meal, and from four to seven pounds of ground grain, well mixed with the cactus pulp. The dairy cows run on natural grass pasture and eat the cactus freely and readily. Each growing hog is fed about ten pounds of cactus, one pound of cotton seed meal and two pounds of some other ground grain per day.

During the last month or six weeks before marketing our hogs the cactus is omitted and the meat is hardened by feeding nothing but cotton seed meal, ground barley, and ground corn. Sometimes a little barley hay as roughage is fed to hogs when cactus is fed.

We are now experimenting with the fruiting cactus. Mr. Burbank claims that his fruiting cactus will produce ten tons of pears per acre each year, and that these pears run from six to 14 per cent sugar. We fed from about one-half acre of the fruiting cactus the past season about three or four tons of pears including the mother leaves. When the pears were cut the leaf to which the pears were attached was also cut off. The pears were hauled to a field where there were about 120 or 130 young hogs, and by the time the wagon was unloaded every pear had been eaten. Seldom has the writer seen hogs eat food with greater relish. These pears were three or four inches long and two inches thick, some red and some yellow, and so ripe that some of them would break open when they struck the ground. It would seem that if an acre of ground will produce ten tons of these pears which will run from six to 14 per cent sugar it would make a very fair hog feed. Our experience has been that cactus cannot and should not be fed by itself. It is about the same consistency as green fodder corn, and some concentrate like cotton seed meal or ground barley should be fed with it to get the best results.

YIELDS OF VARIOUS SORGHUMS

ANSWERING request of the Cultivator as to average yields of various sorghums Prof. John W. Gilmore, of the university farm at Davis, writes:

"There are no statistics for the state as a whole on the normal yields of these crops. The census of 1910 gives figures for kafir, but by that term is meant practically all of the grain sorghums, no segregation being made. In our studies of these crops we find that the yields of each variety vary widely in different parts of the state, according to type of soil, preparation, and culture of soil and moisture supply. We find also that the yield varies widely one year with another, owing to various reasons of which, perhaps, moisture supply is most important. Our average yields for the past four years at Davis for the several varieties, are as follows—the figures also show the range:

Variety—	Range Lbs. Per Acre.	Av. Yield Per Acre Lbs.
Durras		
White Durra	223-2520	1015
Dwarf Milo	2214-5031	3575
Standard Milo	1492-4830	3041
White Milo	1974-4693	3176
Brown Durra	1521-5071	3151
Feterita	1953-3164	2909
Kafirs		
Dwarf Black Hulled	959-3209	1962
Early Black Hulled	618-2520	1518
Black Hulled White	64-2600	1274
White Kafir	1092-1533	1342
Red Kafir	128-1434	782
Pink Kafir	504-2667	1883
Pink Kafir	504-2667	1883
Kaolings		
Brackets Black Hulled	777-4662	2520
White Kaoliang	325-1071	698
Manchu Brown	777-4436	2404
Brown	903-4284	2962
Shallu	1816-4609	3542

"In some instances the very low yield is due to serious bird damage—this being one of the leading causes for low yields throughout the state for some varieties.

It will be noted that Dwarf Milo and Brown Durra stand about the highest. This is corroborated by general experience throughout the state. Of all the varieties these two are, perhaps, more generally adaptable."

A lot of 44 bales of cotton grown at Pima, Arizona, was recently sold at 58.6 cents. This will be used for thread making.

Growing San Joaquin Sugar Beets

SAN Joaquin is becoming a big sugar beet grower. There are two factories now being built, one near Tracy and another at Manteca. Another is to be erected near Stockton. Because of many requests for instructions in growing sugar beets, Farm Adviser R. D. Robertson gives the following cultural directions:

"The importance of leveling land properly cannot be emphasized too strongly, since the securing of the best yield will depend largely upon this feature of the work. There are many fields in the South San Joaquin district where beets have been drowned out or scalded in attempting to distribute water over uneven surfaces. The leveling of land may entail considerable expense, but usually it pays for itself many fold. It is better for the grower to restrict his area and put it in proper shape than to endeavor to handle a large area of poorly prepared land and meet with partial failure.

"In the vicinity of Manteca many fields are not surface irrigated but depend upon sub-irrigation. Where irrigation is practiced a more uniform distribution of water can be obtained by running water in furrows than by any other method. The flooding method is now commonly used, and the farm adviser hopes to carry on some demonstrations to determine the relative merits of different methods of irrigation.

"The necessity of deep plowing is generally recognized, and subsoiling in many places will be found advantageous. The preparation of a good seed bed is highly important. The seed requires a uniformly fine, firm, moist bed in order to produce a quick and uniform germination. The more quickly the seeds germinate the more certain is a good stand, which is the first requirement of a satisfactory crop. In this county from 12 to 18 pounds of seed per acre are planted in rows 18 inches apart, most of the planting being done previous to March 1. The beets should be spaced and thinned just as soon as possible after they are up. This can usually be done when the plants have from four to six leaves. The beets should be thinned to one in a place from ten to 12 inches apart in a row, although this distance is governed by the fertility and moisture-holding capacity of the soil.

"Frequent cultivation is necessary for the destruction of weeds, retention of moisture and the aeration of the soil. The constant aim should be to keep the beets growing from the time they come up until they are harvested, and to destroy just as few of them as possible. The beets are plowed out by a specially constructed plow and are topped by cutting off each plant at the base of the bottom leaf.

"Experience in the old beet-growing districts shows that crop rotation is necessary in maintaining the soil at its full productive capacity. If the beet tops are returned to the soil in the form of manure, little plant food is removed by the beet crop. Heavy yields of grain can be secured after beets are grown, due to the excellent condition in which the soil is left by the beet crop and to the depth of the root bed occupied by the beet roots The best crop rotation for this county is yet to be worked out, but will include alfalfa, grain and some cultivated crops, such as potatoes, beans, melons or corn.

"The cost of growing sugar beets will vary from $30 to $40 per acre. Average yields of ten to 15 tons per acre are secured, although many growers have obtained much higher yields. Various type of contracts are made by the sugar companies and a current price is at a flat rate of $5.50 per ton, the companies reserving the right to reject beets testing under 11 per cent sugar.

SUGAR BEET THRIPS

The sugar beet thrips is an imported insect recognized as a greenhouse pest and also injuring outdoor plants, principally sugar beets and sugar cane, according to a recent professional paper of the United States department of agriculture, by William H. White, bureau of entomology. The insect is dark brown or black in color, and about 1.3 millimeters in length. The injury caused is similar to that of other species, such as the onion thrips and bean thrips. The plant is attacked by the adults and by the nymphs, or young, in the same manner. The leaf cells are pierced, and the plant juices withdrawn, causing the cells to shrivel and turn white. When a number of these cells are destroyed they appear as irregular white or light brown spots. If the attack is severe the whole leaf surface becomes invested by these spots and finally shrivels and dies.

Spraying has been found to be the most effective means of controlling this insect, both in the greenhouse and out of doors. The following solution used in one experiment killed all adult insects and about 95 per cent of the nymphs: Nicotin sulphate, 6 ounces, fish-oil soap, 4 pounds; water 50 gallons.

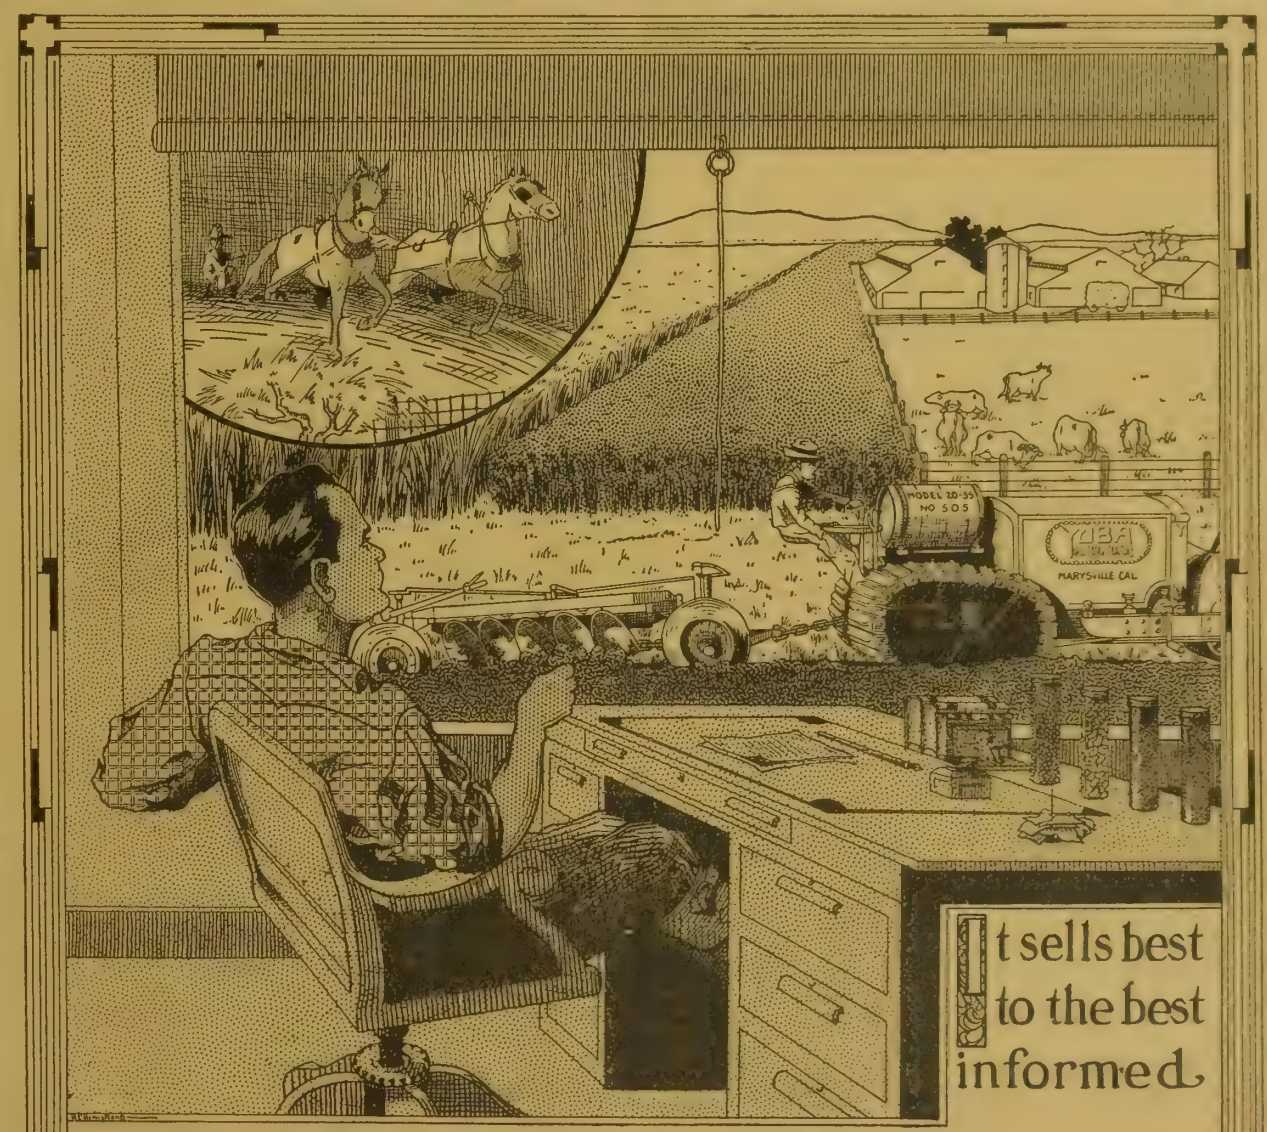
The spray should be applied to both sides of the leaves; if possible on a dull or cloudy day. The adults are not so active at this time and are therefore less likely to move out of reach of the spray.

In the greenhouse the sugar beet thrips may be held in check by the application of a strong spray of water to the foliage. This washes the younger stages from the leaf; and as these are unable to reach the food plant again they soon die.

"Just after harvest is the time to go over the farm auto and put it in shape for fall and winter use," says G. W. McCuen, motor specialist for the agricultural engineering department of the Ohio state university. "By removing the oil from the crank case at least once every spring and fall one can be sure that the crank case is free from sediment. The motor can be cleaned by washing it with kerosene. The differential and transmission will only give the best service when properly oiled, and the exhaust valves will give no trouble when they are kept well ground," he states.

Mr. McCuen recommends the use of a high-grade cylinder oil; one which will cost not less than 40 cents per gallon. Such oil will have the least carbon deposit.

How long did it take to repair your last puncture? Did the last patch you put on come off when you were half way to town? Then you ought to get a small vulcanizer, which can be purchased for $2 or $3. It can be carried with you, and if you run out of good tubes, one can be vulcanized in 20 minutes. Auto owners report trouble with patches coming off during hot weather due to the heat loosening the cement. With a vulcanizer any snag or puncture can be completely seared over, thus preventing the tire from weakening through the admission of water or moisture.



It sells best to the best informed.

The Business Farmer

HE runs his farm by efficient plan and *system*. He figures on the *cost of production*. Where he can save *time*, *money* and *crops* by using a tractor—*he does it*. He is an investigator and thorough business farmer—that's why he buys the Yuba—*what about you?*

for long life and low upkeep cost:
BUY A YUBA

Factories at Marysville and Benicia, California

Yuba Manufacturing Company Dept. B-9
433 California St., San Francisco, California
Gentlemen: Kindly send me catalog and prices on the Yuba Ball Tread Tractor.
I am interested in Model 12-20____ Model 20-55____
Name____
Town____ State____
P. O. Box____ Size of farm____
[Check main crop raised]
____Fruit ____Rice ____Grain

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The cover illustration on this issue shows the use made by vineyardists of some of the waste waters of springtime. It also shows growth of vines in this vineyard about as it appears today. It may also be considered a reminder that we are approaching the time when mildews and other orchard diseases should be discouraged. Make use of these waste waters; make use of sulphur over the vines; keep the cultivator in motion. When harvest time comes compensation will be received.

SHOW THE COLORS

In a hundred-mile drive recently we met thousands of autos, and nine out of ten with the flag fluttering from some portion of the machine. It looks good.

Fling Old Glory to the breeze.

OLIVES

Too early yet to predict anything as to this season's output of olives, but to the olive grower we would suggest careful consideration of market conditions before contracting his crop this year. Prices will be good. This is inducing renewed interest in planting. Planting is not heavy, but the wise orchardist is considering olives, and the planting is far more liberal than anticipated.

FRUIT PROSPECTS

Apricot growers are still watching earnestly weather conditions for indications of damage by cold of the last few weeks. As a rule we think a more hopeful view is held than a week ago. Trees are in good condition, apricot bud disease is less in evidence and the second bloom looks well. We believe peaches will make a big showing. It is yet too early to predict as to prunes. Prices, however, promise to be good.

MORE TOMATOES

Already contracts are being made for more liberal planting of canning tomatoes than any preceding season. There is a shortage of almost everything eatable, and every producer with vacant ground should investigate as to what it can grow which will add to the farm's profits. To the owner of an orchard just planted the space between trees is too valuable this year to waste. Put the ground in best condition, secure best seed, give of the most experienced care and produce to the limit.

BEANS

If present estimates of bean prices the coming season are correct millions will come to California for our bean crop. It has been estimated that one ranch alone will produce this season over $1,250,000 worth of lima beans. This is the great Irvine ranch in Orange and San Diego Counties. It has been rumored that $9.30 has been offered to some growers for the coming crop, but conservative growers think no such offer has been made by thoroughly responsible buyers who could make good if a slump should occur. However, it is stated that $8.25 contracts are being freely made.

ORANGE PICKERS STRIKE

Several packing houses in the orange districts have closed because of a strike of picking gangs to enforce demand for a higher wage. During a few days of last week not a gang was picking in the Riverside district. Packers at Redlands secured an injunction compelling strikers to refrain from interfering with other pickers who were taking their places.

With prices as they are at present, and this the period of the year when the heaviest shipping should be under way, this strike means severe loss to the orange growing industry, but it is hoped that normal conditons will soon obtain.

PULL TOGETHER

It is said to be essential to complete cooperation that the grower be driven into it by his own failure. Also it is true that one of the most trying times for a new cooperative organization is a season of high prices and keen demand. With an intelligent class of producers such as we have in California these difficulties are in part overcome, for sure it is a high grade of intelligence is required for a successful cooperative organization. But in spite of this the prune and apricot growers of the state are confronted by a serious condition in their effort to organize. Prices are abnormal; the demand is of the keenest; holdover there is none; and every man feels that he can stand alone. All are aware that on the average cooperation will yield greater returns to the industry, but in the hope that the mass of the growers will cooperate leaving "just me outside to market as I please", a few are refraining from signing up with the new organization.

And to encourage this the shrewd outside buyer is very genial and very free with his offers. Unfortunately he is succeeding to a degree. We note in the San Jose Mercury:

"Suppose the incredible happens. Suppose that so many growers are fascinated by this inviting offer, contract for sale on these terms and hold out of the organization in consequence, that the whole cooperative movement falls through. Then how are these contracting growers fixed?

"The packer would of course be in the position of having contracted to pay on a six-cent basis—perhaps even up to seven if he so decides—on the assumption of a high minimum price, which has now vanished. Can any intelligent grower suppose that, with a good yield and the consequent decline in price, those six or seven cents would be forthcoming? He knows perfectly well that it is easier for a camel to go through the needle's eye than for his contract to prove watertight if the packer finds it desirable that the price come down. His prunes would not pass muster for a moment with the contract conditions, and he would be fortunate to obtain three or four cents for his pains.

"The grower then will do well to study the unwonted situation very carefully before concluding an independent contract for his prunes on an apparently substantial and attractive proposition."

Thre is no use of making an appeal to these growers. It is a matter of common sense and common business foresight to support this organization. Every prune grower who is intelligent and who has a grasp of business principles must see the necessity of securing the association.

Agricultural Notes

A few years ago country highways were merely a possible outlet for cement. Last week Vermilion County, Illinois, ordered 190,000 barrels of cement for concrete road construction now in progress.

U. S. A. Apple Forecast.—The forecast of the apple crop this year in the United States, as estimated by the U. S. A. department of agriculture, totals 303,000,000 bushels, or 27,000,000 bushels less than last year.

Four trainloads of beans from the Orient, valued at over $1,000,000 and constituting the largest single movement of this commodity ever coming to the United States, have arrived in San Francisco to be shipped to eastern markets.

The government of Peru last fall passed a law providing for government loans to farmers and stock raisers on agricultural implements, sawmills, live stock, meat and dairy products, fruits growing or harvested, timber and lumber.

Experiments in bread making, using cotton seed flour as a substitute for part of the wheat flour, have been made by the department of agriculture for the West Indies. The bread is declared to be very palatable, having a rich, nutty flavor.

The German government announces that all grains and legumes still in the hands of consumers above limited quantities will be seized for the benefit of the public. This is a result of the recent census which revealed a shortage from the expectations of last fall.

The agricultural schools in South Africa, six in number, give courses of one or two years to boys intending to become farmers, not with any idea of their becoming specialists. Special courses of six or nine months are, however, arranged for dairying, qualifying students as managers of cooperative dairies.

The exceessively cold weather of January throughout European countries has seriously injured fall plantings. In Great Britain and Ireland heavy snowfalls with icy winds prevailed during the greater part of the month and caused much retardation in field work. In Italy the weather was almost as inclement as in the other two countries mentioned.

The British Tommy, home on leave from trench digging, now passes most of his time digging and hoeing truck gardens. The first of February there were 25,000 plots of allotted garden land under cultivation, giving some idea of the speed with which the people have taken to the spade and plow since the authorities have tried to arouse them to the danger of starvation.

Texas has planted over 12,000 acres to Bermuda onions this year or more than 2000 in excess of last year. Imperial and Riverside Counties in California have planted 1435 acres this season. Louisiana, another onion-producing state, has planted 3000 acres. Last year California's shipments from the two counties mentioned was 326 cars. California's small express shipments are also very great in number.

Regulations governing exports of Hawaiian pineapples and bananas to the Pacific coast require that the shipper have the fields from which the fruit is to be taken inspected by the fruit-fly investigation bureau of the United States department of agriculture, Honolulu. Pineapples are packed in dry excelsior and bananas in banana leaves. It is required that the containers or wrappers shall be new and of materials approved by the inspector.

Agricultural News Notes of the Pacific Coast

Northern California

Santa Rosa's annual rose carnival will be held this year, May 10, 11, 12.

Jersey breeders of the Orland district of Kern County have organized an association.

State Horticultural Commissioner Hecke is distributing seed of Egyptian long fiber cotton.

Farmers of the Upper Mattole will plant heavily to beans this year, with potatoes second in acreage.

The California Ripe Olive Company will operate its Oroville plant on tomatoes during the summer.

The Arbuckle-College City Almond Growers' Association reports accession of several new members.

Supervisors of Shasta County have passed an ordinance requiring every dog in the county to be licensed.

Boys of the agricultural club of the Ferndale high school will grow potatoes for their this year's contest.

Stockmen of Napa County report pasturage in excellent shape and cattle and sheep in best of condition.

The Napa County Agricultural Association has been organized and is ready to start plans for the 1917 county fair.

The Poultrymen's Association of Cotati, Sonoma County, has decided to hold its meetings the first Tuesday in the month.

Yolo County is reported to have over 2500 cows signed up in the Sacramento Valley Cooperative Dairymen's Association.

The Trinity Land and Cattle Company has bought 5000 acres of grazing land in the Bald Hills country near Cottonwood, Shasta County.

The recent campaign of extermination against rabid coyotes in Modoc and Lassen Counties has resulted in the d struction of 2707 coyotes.

Humboldt County has just paid out over $80,000 for its share of the expense of constructing the new bridge across Eel River south of Scotia.

Berry Growers of Happy Valley, Shasta County, have formed a marketing association with C. C. Cutler president and I. N. Millsap secretary.

According to report of County Horticultural Commissioner Lamiman of Shasta County more olives will be set out in that county this season than any other variety of orchard trees.

The Yolo Democrat reports sale of $40,000 worth of sacked barley and wheat from the Hershey Estate of Woodland and says this was one of the last big lots of grain held in the state by farmers.

H. G. Asselstine, who has been cow-tester of the Napa-Sonoma and Napa-Petaluma Cow Testing Association, has been appointed by the state dairy bureau, inspector for Siskiyou, Lassen, Modoc and Shasta Counties.

Almond growers of the Chico and Durham districts of Butte County have organized as a branch of the California Almond Growers' Exchange. The association expects to build an almond warehouse on the line of the Northern Electric at Durham.

The board of supervisors of Eldorado County has rescinded its action, taken at the February meeting, and has reestablished the office of county horticultural commissioner. This action will automatically continue J. E. Hassler in the office of county commissioner.

Central California

Lindsay, Tulare County, reports an immense acreage being planted to citrus fruits.

The Kings River Irrigation District has applied for 20,000 feet of the waters of Kings River.

A. R. Bates of Modesto has been appointed by the governor to membership on the state dairy board.

A new plant of the National Ice Cream Company is to be built at Stockton, San Joaquin County.

A lime mill has started operations at Porterville, Tulare County, with a daily capacity of about 70 tons.

The recent frosts are reported to have done some damage to almond crops in the eastern section of Stanislaus County.

Forty-two thousand acres in the Chowchilla Ranch in Madera County are reported to have been sold to Swift & Company of Chicago.

The San Joaquin County farm bureau will hold local meetings at Lockeford April 9, Linden April 11, Bellota 12, Escalon 16, Ripon 19, Manteca 20.

President Wilson will press the button that will open the Third Annual Butte County Spring Exposition in Chico May 21. The fair will last six days.

The Tulare Cooperative Poultry Association transacted a total business of $11,122.98 last February, more than doubling its February business last year.

Stanislaus County had a big roads celebration on March 22, the occasion of the opening of the new $110,000 concrete bridge over the Tuolumne River at Modesto.

Many of the smaller stockmen of the state are objecting strenuously to the proposed hide and brand bill introduced by Assemblyman Horbach of Tulare County.

The San Joaquin Valley Counties Association will send its three-car advertising special on a tour of the San Joaquin Valley before taking it East. The tour will begin April 15.

A meeting of the Tulare County Canning Peach Growers' Association was recently held at Visalia to name a sales commission to take charge of the entire crop of members.

Alfalfa growers of the district about Dinuba are planning to form an association which they hope will lead to the organization of a state body to take hold of marketing problems.

The California Prune & Apricot Growers' Association has opened its final campaign of stock sales, which must net another $200,000 to bring the association into control of 75 per cent of the state's crop.

Manager Niswander of the Peach Growers' Association has issued a statement to packers that no more orders can be received for 1917 unpeeled peaches as advance sales are now up to the estimated crop.

The Tulare County Swine Raisers' Association is holding a meeting at Visalia today, March 31. The association is considering whether or not it will take part in the stock and swine show to be held at Visalia this fall.

Contracts of the peach company were upheld in decision of the suit brought by the California Peach Growers against a peach grower of the Fowler district for $200 for dried peaches not turned over to the company.

Southern California

Corona now feels assured of securing a cannery.

Imperial shipped out its first carload of asparagus last Tuesday.

Ventura County will hold its fall fair the last week in September.

The Lankershim Laconic estimates damage to apricots at 50 per cent.

The Riverside district shipped out 199 carloads of citrus fruit last week.

The Santiago Citrus Growers' Association is planning to erect a precooling plant.

Many hundred acres will be planted to Tepary beans in the Hemet Valley this season.

Citizens of San Jacinto are much interested in the securing of a sugar beet factory.

Orange County has between 10,000 and 12,000 sacks of Lima beans held in storage by owners.

Fruit men of Banning are planning to ship most of their fruit to Arizona, New Mexico and Texas.

R. L. Taber of Riverside has been appointed secretary of the Riverside County Fair Association.

Machinery is being installed in the walnut house at Garden Grove for the handling of the orange crop.

Riverside is panning to organize a county farm bureau. Several locals have already been organized.

The Arlington Cannery has leased a building which it will fit up with machinery in time for the canning season.

The Temescal Water Company has subscribed $1000 toward the work of building firebreaks and trails in the Temescal Range.

Bean growers of Santa Paula held a meeting last week in conjunction with business men of that city to discuss possibility of establishing a bean cannery.

The area of early Irish potatoes in the San Gabriel Valley, San Fernando and Los Angeles districts, and Orange County is stimated to be 8700 acres this year.

A suggestion has been made that Imperial Valley orchard planters unite and ship in carloads of trees for this year's planting. The demand for orchard trees is heavy.

Manager Shipley of the Lima Bean Growers' Association announces that the association has secured a market at $7.50 for all beans that can be delivered in September.

San Jacinto has been promised a beet sugar factory if growers will sign up 10,000 acres. Fifty thousand acres are said to be available for beet culture in that district.

Says the Hemet News: "Old H. C. L. has put the fear of added expense in the hearts of Hemet housewives, and the garden spots are much more plentiful than usual.

Last year's campaign of the Anaheim Sugar Factory lasted 116 days, the longest in the history of the factory. Eighty thousand tons of beets were sliced, producing 28,000,000 pounds of sugar.

Directors of the San Antonio Growers' Assocation are canvassing in the Chino district to ascertain the feeling of the members as to advisability of building a cannery at Chino this year to handle fruits and vegetables.

The Coast

The Coquille Valley of Oregon shipped 1,500,000 pounds of cheese during 1916.

The Puyallup Valley of Washington expects to plant 2200 acres to potatoes this year.

Farmers of Crook County, Oregon, have formed the Central Oregon Bull Association.

A grain farmer of Enterprise, Oregon, has contracted his 1917 crop at $1.50 per bushel.

Rosalia, Washington, will hold its annual fair and live stock show September 27, 28, 29.

The Fruit Growers' Agency of the Northwest will hold its annual meeting April 9 at Spokane.

Several loads of hogs were sold at the North Portland union stockyards last Monday at $14.00 and $14.25.

Fruit growers of Peach, Lincoln County, Washington, have formed a corporation to market their products.

Arizona cattlemen now have a freight rate of $94 per car to Los Angeles as against the old rate of $126.85.

Many Northwestern wool growers are holding and urging their neighbors to hold for the big prices which they feel sure of getting later.

The Lakeside Farm Association of Arizona has arranged to purchase a carload of dairy cows, bringing in Shorthorn and Herefords from Iowa.

The Pomona Grange of Lane County, Oregon, will hold a corn show in Eugene next fall. This will be the first show of this kind in the county.

Stockmen of Willcox, Arizona, are feeding the wild yucca stalks to their cattle. The leaves are cut or burned off and the stems sliced in an ensilage cutter.

The question is up whether the 130,000 boxes of Hood River apples now in storage shall be taxed as personal property or whether they were taxed in the orchards last year.

The new grain standards bureau for the Northwest will be located at Spokane, Washington, and will open for business on April 1. The new grain standards law goes into effect on July 1.

A special train of 30 tank cars filled with Japanese soy bean oil has just been sent from Seattle to Cincinnati to be used in a soap manufactory there. The oil is used in replacing beef and pork fats which have become too expensive for soap making.

The government wool car has been making a demonstration tour in Washington throughout the month of March. The car carries a moving picture outfit showing handling of sheep from the range to the market and of the wool from the fleece to the cloth.

Over 2,000,000 acres of grazing grounds of the Western states have been freed of prairie dogs and other rodents through the activities of the United States biological survey. A large part of the work was done in the naional forests of Arizona and New Mexico.

The newly appointed state highway commission of Oregon is now organized and ready to begin the study of the highway needs of the state. The commission has divided the state up into three districts, which will be personally inspected by three divisions of the commission.

Make the REMCO Silo YOUR Silo

Because

it is constructed throughout of nothing but AIR DRIED REDWOOD.

Because

it is made by skilled mechanics who use the most modern wood working machinery.

Because

it is used and approved by hundreds of California owners.

Because

it will last longer and make better silage than any other silo.

LET US QUOTE YOU ON OUR GUARANTEED REMCO PIPE in all sizes from two inches to twelve feet for your irrigation work.

Call on us for assistance in Silo, Tank and Pipe problems. Your requirements will be fully met in every particular.

Redwood Manufacturers Company

1604 Hobart Building -:- -:- SAN FRANCISCO

Santa Anita Rancho

Anoakia Breeding Farm

ARABIAN-THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three-year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars, Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

Live Stock Notes from Northern California

Written for California Cultivator By W. S. Guilford

SILO BUILDING PLANS

ALVA Slocum built one of the first silos in Glenn County. He has filled it two or three times. In 1916 a good many other silos were built in different parts of the district, and according to present plans 1917 will be a regular "landslide" year in silo building. Almost every farmer within two miles of Slocum's will build this year. We counted 12, all close neighbors, who are planning to buy one or another of the good stave silos that are advertised in the Cultivator.

Silo building progresses in much this same way in every county, with the exception that in older countries, like districts in Northern Illinois, for instance, it takes ten years to accomplish what can be done here in three.

This silo building activity is very gratifying to me. When I started to talk silos for Glenn County in 1910 there was not very much interest in the subject. Some said: "What do we need of silos when we have green feed the year round?" Others said "Well, a silo might be all right for the first cutting of alfalfa, but we can never grow corn enough to fill silos." But most folks were just indifferent to anything like an innovation.

Silo building did not really start until about three years ago. In two years more it would not surprise me if Glenn County had more silos in proportion to the number of farms than any other county in the state.

And more Indian corn will be grown to put in silos in 1917 than ever before. Many enthusiastic silo advocates have thought that feterita, milo, Egyptian and other durra and sorghum corns would need to be used for silo filling, but "that's good enough" was their idea.

Now it has been found that a big tonnage of Indian corn can be raised. The worms bother it some, and there is considerable smut some seasons and on some fields, but it is the great silage crop in spite of this.

Silos accompany successful agriculture everywhere.

THE MEAN BULL

Sometimes we hear a recommendation for a dairy bull that is like this: "He is as kind and gentle as a kitten; any one can handle him."

But this kind of dairy bull, one with no evidence of a highly organized nervous system, is apt to produce very few high testing cows. But when you have a real dairy sire, and he is inclined to be mean, every convenience should be provided for handling him so that no one will be in danger. The bull pen and shed and gates should all be of heavy plank, and extra heavy hinges and locks should be provided.

Bloat in Live Stock

Cattle and sheep are very susceptible to injuries from bloat when pastured on alfalfa. Extra care is necessary to avoid deaths, and many times not a few animals will die in spite of the greatest care possible. It is always wise to give animals a full feed of alfalfa hay, corn fodder or other food before turning them out on alfalfa pasture. The alfalfa should be fairly well matured and of a dark green color, for it is the light green alfalfa which causes bloat. Animals that have not been accustomed to alfalfa should follow those having grazed the field down, leaving nothing but the coarse woody stems and a small portion of green shoots. After being left on such a pasture for a while they may be graduated to other fields with more alfalfa. Supplying the animals with alfalfa hay or other dry food along with the alfalfa will also have a good effect in checking the bloat.

Since the new shoots are the portions of the plant which cause bloating, it is wise to turn animals into an alfalfa field for only a few minutes for the first time, ten minutes is probably sufficient, and not more than 20 minutes at a time for the first week. After this time the period may be lengthened and the animals allowed to graze at will. It will thus be necessary to turn the stock into the field two or three times a day, and they should be taken off before they begin to bloat. By allowing some of the animals to graze over a fresh area and secure a small amount of heads and turn them back onto the main stems little bloat will result. This is probably one of the best ways of preventing the trouble.

Cure

It has been found that moving animals around and compelling them to exercise relieves somewhat those that are suffering from bloat. A dose of formalin, consisting of 40 cc (or three tablespoons), for a mature steer, or one-fourth of this amount for a calf, has a specific effect in relieving the formation of gas in the stomach. Some run a rubber hose down the throat into the paunch and the gas is liberated through it. A small teacup of kerosene and one-half pint of sweet milk is also a good specific for this trouble. A small amount of turpentine in this mixture would also facilitate relief. When an animal is so far gone as to stagger and be almost ready to fall, it will be wise to use the trocar and canula, by puncturing the rumen just below and in front of the hip bone. In extremely bad cases where the attendant cannot secure these instruments the animal may be given relief with a pocket knife, but it is best not to puncture unless necessary, as this leaves a wound which heals slowly and the stomach contents may ooze out of the paunch into the stomach cavity, and thereby cause infection.—R. H. Williams, Animal Husbandman, University of Arizona.

Cooperative Bull Associations

There are now more than 30 active cooperative bull associations in the United States. On July 1, 1916, there were 32 representing a total membership of 650 and owning about 120 purebred bulls.

The cooperative bull association is especially adapted to herds which are so small that a valuable bull for each herd would be too heavy an investment to be justified by the extent of the business. Through cooperation, cattle owners are enabled to obtain the benefits which come from the use of a purebred sire at an expense which is no greater, and in many cases is even less, than the cost of maintaining a scrub.

"Better and fewer bulls" is a phrase which represents the aim of these associations. A typical organization is composed of from 15 to 30 farmers who own jointly five bulls. The territory of the association is divided into

five breeding blocks and one bull assigned to each block. To prevent inbreeding each bull is moved to the next block every two years. Barring losses from death or other causes, therefore, no new bulls need be purchased for 10 years. It is customary to apportion the purchase price, and the expense of supporting the bulls, among the members according to the number of cows owned by each.

FOUR HUNDRED LAMBS ON NURSING BOTTLES

Written for California Cultivator
By C. A. Briggs

Twice a day on the farm of the J. S. Gibson Company at Williams, 400 lambs fill up on milk through rubber nipples. Mr. Gibson has designed a novel rack holding 15 quart bottles and it is an interesting and amusing sight to see the line of lambs working on their foster mother. The lambs are taken from the ewes having twins, leaving one with the mother who, owing to the scarcity of feed, is unable to care for them both. Mr. Gibson is feeding about 175 gallons of milk a day and will by this means save hundreds of lambs that would otherwise have died. The little fellows are plump, strong and active and will without doubt pay handsomely for both the feed and labor used in their care.

SAVING RANGE CATTLE

Notwithstanding efforts on the part of the forest service and stock owners to reduce the loss of live stock on the national forest range in California, a recorded loss of almost 7000 head of cattle and sheep was reported during 1916. Twelve hundred and forty-six head of stock died from disease, 1552 from poisonous plants, 2249 from predatory animals, 380 from accident, and 1465 from miscellaneous and unknown causes.

The diseases responsible for 42 per cent of the cattle loss are blackleg, anthrax, and abortion. Blackleg, it is said, can be prevented if stockmen will practice systematic vaccination on all young stock each year in communities where the disease is known to be prevalent.

An experiment on the Inyo national forest during the past season showed the value of the serum-vaccine treatment for anthrax. One thousand fifty cattle were treated out of a herd of 2000. After the period of incubation, five days, only three head of the treated cattle died, while 25 head of the untreated stock were lost before being removed from the allotment. The serum-vaccine treatment for anthrax can be obtained from commercial laboratories.

HOMEMADE CREAM CHEESE

Select a quantity of very rich sweet milk, or if thin milk is used, add ten per cent of sweet cream. Mix with this three to five per cent of its bulk of clean well soured skim milk, or better still, this amount of a good starter.

Set the mixture with rennet at about 80 degrees Fahrenheit, and when well coagulated, cool down to 60 degrees Fahrenheit, by placing in the refrigerator, or allow cold water to run around it. Care should be taken not to break the curd. After it has cooled for 24 hours, turn it into a cheesecloth sack and allow to drain for another 24 hours. It will then be ready to salt.

The presence of the fat makes a very soft smooth cheese. It can be moulded into balls or printed in a butter printer and wrapped in oil paper and tinfoil.

Owing to its high moisture content, this cheese will not remain fresh longer than a week, and should be kept on ice.

NEED PURE WATER

A farmer remarked the other day when I took dinner with him that his great problem was how to secure a pure water supply for house use. It was apparent from the drift of his conversation that he was not concerned about the quality of water for his livestock, anything was good enough for them.

The same laws that govern health pertain to the lower animals as well as to man. After dinner I looked around a little and found that the water for his animals came from a surface well near the stables. As it happened it was not strongly alkaline, but it was stagnant, teeming with animal and vegetable organisms, the result of contamination with animal excreta and barnyard refuse. The amount of organic matter in it made it unfit for any animal to drink. This man complained of having had "hard luck" with his livestock.—Geo. H. Glover, Colorado Agricultural College.

THE FAMILY COW

The family cow should be a constant source of cheap, pure and delicious milk. Such may be the case if a few precautions are taken, says Percy Werner of the Missouri College of Agriculture.

A cow may be suffering from tuberculosis, the worst disease to which she is subject, and still show no signs of it. For the sake of the children who drink the milk a qualified veterinarian should be called upon to inspect and test each cow every year.

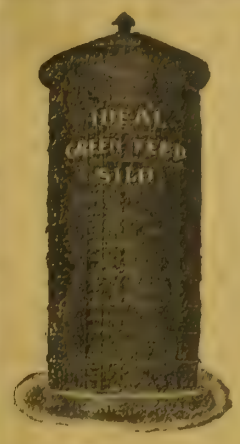
With the assurance of a healthy cow she should be housed in a clean, well lighted shed and provided with a clean yard in which to exercise. The milk should be drawn into a clean, small topped milk pail and kept cool until consumed.

Milk sours and spoils because of the bacteria which enter it with dirt from the cow and from pails not thoroughly washed. Keeping these bacteria out of the milk and preventing their growth by keeping the milk cool, are easy and efficient means of procuring the best of milk from the family cow provided she is free from disease.

If thinking of building a hog house or remodeling the old one a few timely suggestions may be of value. In the first place locate the house in such a manner that you may get direct rays of sunlight into every pen, as sunlight is a most effective germ-killer. Arrange for a system of ventilation; a hole cut in the roof is not sufficient. Have plenty of pure air, but do not allow the hogs to sleep in a draft.

An authentic gestation table is of value to every breeder of livestock and should be kept in a convenient place where he can refer to it at any time. We never get strong pigs under 111 days; sometimes ewes will wean at 145 days; a very few cows will calve at nine months even; mares usually run a few days over eleven months.

To look only at the pedigree without considering the individual or the performance record back of it is a poor method of improving the herd, no matter what kind of live stock is kept.



Borrow Money at 6 per cent and make 30 per cent with an IDEAL GREEN FEED SILO

Now is the time to place your order for an IDEAL GREEN FEED SILO. Put that first crop of alfalfa into it. It won't make good hay, but the alfalfa, foxtail and weeds will make excellent silage. Have silage to feed this summer when green feed is gone. You can thus increase your milk profits 25 per cent and reduce feeding costs 15 to 20 per cent during the coming dry season. The silo will be empty in time to fill with corn this fall for winter feeding.

Refrigerator Type Doors; Air and Water Tight Foundation Joint; Proper Design; Selected Materials and Painstaking Workmanship make the Ideal Green Feed Silo a Safe, Profitable Investment for the Dairyman or Stock Raiser. Send for Catalog.

Acme Feed Cutter and Silo Filler

Mounted on Truck — Low Feed Table — Rigid Construction
All Steel Frame — Automatic Feeding Device — Light Running
Positive Safety Device — Reversible Feed Rollers — Easy to Handle

EQUIPPED WITH ALFALFA MEAL MAKING ATTACHMENT

An excellent quality of alfalfa meal can be produced on this machine at a cost not exceeding half of that for baling.

SAVE $3.00 PER TON ON DRY FEED

Run it through an Acme Feed Cutter so that the coarse hay as well as the fine will be entirely consumed by your cattle.

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY
YOUR COWS MADE PROMPT, REGULAR BREEDERS BY
STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion, the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case where STERILOID FAILS to make good. Price $1.00. Mailed postpaid, in plain wrapper.

Gerben Abbekerk Maid

A Great Holstein

Under practically dairy conditions Gerben Abbekerk Maid 180387, a Holstein owned by Stalder Brothers, Riverside, has made a wonderful record. As to the results of the official test, she lacks a fraction of a pound of equaling the California record.

But in addition, and not considered in the official test showing equal amount of butterfat produced, Gerben Abbekerk Maid has produced from May 12, 1913, to February 26, 1917, five of her offspring, three heifers and two bulls, which promise also to be record breakers: First, Stanislaus Abbekerk Maid, calved May 12, 1913, as a senior three-year-old produced 25.75 pounds butter in seven days from 571.7 pounds milk. During the same test her 30-day record was 2315 pounds milk from which 102.449 pounds butter were produced. The next calf was a bull, calved May 9, 1914, King Pontiac Netherland Segis 3rd. Next came a heifer, March 29, 1915, Aralia Maid; February 29, 1916, Prince Aralia Skylark, and February 26, 1917, Abbekerk Pontiac—five calves in less than four years.

Officially Gerben Abbekerk Maid, who was calved April 18, 1911, has now tested as a senior five-year-old, seven days, 27.367 pounds fat from 686.9 pounds milk; for 23 days she produced 83.75 pounds fat from 2381.8 pounds milk. Her best seven-day milk production was 806.9 pounds.

Besides the above record of 34.209 pounds of butter it is worthy of note that this cow produced within the same 12 months—or in February, 1916—from 671 pounds of milk 30.1 pounds butter as a senior four-year-old.

The persistence of this cow is also remarkable, for since her first calf in May, 1913, she has been dry less than six weeks during the entire period.

California Wool Growers

Secretary Ellenwood of the California Wool Growers' Association writes that the association was formed some ten years ago:

"The first year we only had about 30 members. We have had our ups and downs since that time regarding membership, sometimes having about 150 paying their annual dues and sometimes not over 50. When things are running along without any serious obstacles confronting the industry members are careless about their dues and let a few good men keep up the work of the association, but if something happens where they really need an organization to do something for them, and they think they are going to lose a lot of money unless the association saves their lives, then a lot more will join for a year or two. So it goes.

"Of course we need a good association and ought to have every man in the state who owns a bunch of sheep, as a member, but it is very discouraging to a few of us who have spent a great deal of time and hard work for ten years trying to build up an organization that is worthy of the name. The few we have are good earnest workers and have always kept annual dues paid as a member of the National Wool Growers' Association and have done many other things that were beneficial to the industry, but we have not the membership that we should have."

JERSEY ORGANIZATION AT ORLAND

Written for California Cultivator
By C. A. Briggs

On March 31 the Jersey breeders of Glenn County met in the Orland theatre to complete the organization of the Orland Jersey Cattle Club. Constitution and by-laws were adopted and the

Great Tulare County Cow

Fidessa Helena, 152737, property of Walter F. Mitchell, 609.9 pounds milk, 25.346 pounds fat, or 31.682 pounds butter on 80 per cent basis.

llowing officers were elected: Presi-
nt, S. F. Williams; vice-president,
L. Leonard; secretary, D. F. Nick-
l; treasurer, A. J. Morey. Directors;
H. Bangham, H. F. Harrold, W. G.
rnett, Chris. Myhre. The organiza-
on starts with a good sized member-
ip roll of exceedingly active and en-
usiastic members who plan to put
e Orland district very much on the
rsey map.

J. M. Roberts, field agent of the Am-
ican Jersey Cattle Club, was pres-
t and made a good talk, on the need
r more and better cows. A moving
cture film, secured from the national
organization by Mr. Roberts, was shown. A number of pictures of the great cows of the breed were shown with their records. Orland has soil, water and progressive local banking support, and now this live organization. The Jerseys and their owners will succeed at Orland.

PASSING OF A CHAMPION

Kilnford Bell 3rd, the greatest of Ayrshires and grand champion of champions in show rings of internationals, state fairs and elsewhere, died recently in Wisconsin. She was an imported animal, having produced in Scotland before being brought to this country 12,000 pounds milk in nine months which tested 4.4 per cent.

Veterinary

Unsigned communications receive no attention.

Skin Disease in Horse

I have a horse whose hair is coming off in spots. The curry comb pulls out tufts of it, leaving the skin bare. The hair has something like dandruff attached to the roots. It does not come out clean as it usually does at the time of shedding. Only the top of the back and the hips seems to be affected. The horse does not seem to itch and does not try to scratch itself, but does like to be curried.—Subscriber, Riverside.

The sample you sent looks like equine pox. It will probably all shed out in time and get all right, but to hurry it up give green feed and keep the bowels loose. Mix a handful of ground flaxseed with the grain twice a day. The best medicine to clear the skin quickly is Fowler's solution of arsenic. Give one ounce once a day in the drinking water or on the feed. Better begin by giving half an ounce once a day for a few days and terminate the treatment in the same manner by reducing the dose. Get a pint of the solution and it will last about three weeks, which will be all you will need.

Ruptured Pigs

Lately we have among our week-old pigs an unusual number of ruptured ones. What may be the cause and how can we prevent it?—Subscriber, Colton.

In a general way one might say rupture was due to overexertion, but why there are more at times than at other times under the same conditions can not be accounted for, so there is no way of preventing it. The remedy is to castrate them by what is called the covered operation. This is done by cutting through the skin in the regular way but being careful not to cut the inner coating or covering of the testicle, drawing this out with the testicle, being careful that the bowel is not included, tying a suture tightly around it all and allowing it to slough off. It takes an experienced operator to do this successfully.

Cow Not Coming in Heat

Will you suggest something to do for a cow that does not come in heat although she has been milked six months.—Subscriber, El Centro.

Your cow needs more exercise and a change of feed. Similar questions have been answered in this column and will refer you to the article in the Cultivator of November 4, 1916, page 440 and March 24, 1917, page 359. You might also get some good suggestions by reading the article on "Preparing a Stallion for Service" in the Cultivator of March 24.

To Reach Cow's Throat

Is there any safe way in which one can put his hand down a cow's throat to remove foreign substances?—Subscriber, El Centro.

The only safe way to reach a cow's throat is by using a speculum, which is an instrument that holds the mouth open and has an opening in it through which you can pass your hand. Veterinarians usually have such instruments for examining the mouths of horses and cattle.

HIGH RECORD HEALTHY HOLSTEINS
H. E. Cornwell has built up a herd of unusually excellent registered Holstein-Friesians from a foundation of only a few cows. That the foundation was right is proved by the high production records, the fine show ring records, and the generally good performance of the herd.
Buyers who appreciate good registered Holsteins will have an opportunity to secure members of this herd at their own price when we sell the entire herd, excepting a few heifer calves, consisting of
38 REGISTERED HOLSTEIN COWS, HEIFERS AND BULLS
at Public Auction to the highest bidder on
THURSDAY, APRIL 19, 1917
on Mr. Cornwell's farm, two miles north of Modesto, California, on Prescott Road.
Here are a few that would look well in any herd in the country:
Cows with official records up to 26.50 pounds butter in 7 days.
Cows with semi-official yearly records up to 707.31 pounds butter in one year.
A 22.10-pound granddaughter of Paul Beets De Kol, 105 A.R.O. daughters with records up to 32.06 pounds butter in 7 days.
A great 4-year-old sired by Oakland Paul Beets De Kol, 39 A.R.O. daughters, and out of a daughter of Sir Gelsche Walker Segis, 33 A.R.O. daughters.
A daughter of Woodcrest Hengerveld De Kol, 38 A.R.O. daughters, and out of a daughter of Sir Spofford Beets, 10 A.R.O. daughters with records up to 26.76 pounds butter in 7 days, all under mature age.
Splendid heifers and cows with high official and semi-official records, bred to PRINCE HISKE WALKER, son of the famous Prince Gelsche Walker and Hiske of Riverside, 26.68 pounds butter in 7 days, 711.57 pounds butter in one year. He is full brother to Lady Hiske Walker, 25.61 pounds butter in 7 days as a 3-year-old, 654.59 pounds butter in one year as a junior 2-year-old.
Prince Hiske Walker Himself will be sold
And any breeder looking for a richly bred herd header of real herd heading quality should be on hand prepared to take this fellow home when he leaves the sale ring.
There will also be a choice offering of young sons of Prince Hiske Walker out of well bred and high record dams.
We will also sell for Mr. Cornwell 6 head of high grade Jersey cows and heifers.
Catalog now ready for distribution. Write for one.

How to Eliminate Coyotes

I believe the sheepmen themselves can do most toward the destruction of the coyote. Every one of them should have a hunter out each season trapping and poisoning. We cannot allow ewes to be destroyed. I think poisoning is by far the most effective method of destruction. I take a little lard and roll it on a board with sugar. When you get a ball of lard about one inch in diameter, make a hole in the center of it and insert a three-grain capsule of strychnine. These baits can then be scattered around, but preferably on old bed grounds just as the sheep are leaving. As soon as the sheep leave, you will find the coyotes flock to the old camp and pick up everything, and they will take the poison if it is there. These lard baits stay hard in cold weather, but when it gets warm, they melt, so dogs will not pick them up the next spring. We put out a number of these baits around our camp in Wyoming this fall and killed 35 coyotes in two nights.

Many sheepmen are afraid to put out poison because they fear their dogs may get it. I believe I could well afford to tie up the dogs and put two herders with each band during the winter. Some outfits are losing from coyotes a sheep a day from each band. If this could be stopped it would soon pay the cost of the extra herder. This winter I have sent out 5000 capsules of strychnine to Southern Wyoming.—A. H. Christensen in National Wool Grower.

Hereford Breeders to Meet

The Pacific Coast is naturally a Hereford country. Herefords are being extensively used in the Hawaiian Islands. Practically every other breed of cattle represented on the coast is already represented by an association Secretary Kinzer writes that such an association should be organized.

Breeders of Herefords in the states of Washington, Oregon, Idaho, Nevada and California and in the territory of Hawaii are urgently requested to attend a meeting to be held at the Palace Hotel, San Francisco, at eight p. m. Wednesday, May 2, in order to organize a Pacific Coast Hereford Cattle Breeders' Association.

The first public sale of registered Herefords ever undertaken in California will take place on the D. O. Lively stock farm at Mayfield, which is about 30 miles from San Francisco, on May 3, and the evening preceding that date occurs to us as the opportunity for breeders of white faced cattle to get together. Secretary Kinzer, Director A. B. Cook and perhaps other officials of the American Hereford Cattle Breeders' Association, will be present.

There was never a time in the history of the industry when there was so much interest in pure bred cattle as at this time, and certainly the breeders of Herefords have come in for a full share of prosperity.

Charles Rule, H. H. Gable, D. O. Lively, Committee.

Carob

In a University of California circular we note reference to the Carob, or St. John's Bread tree, the pod rather, as a valuable stock feed. It must be borne in mind however that seedling trees may or may not produce the feed and to be sure of getting a bearing tree of worth one should graft or bud. The circular says:

"Beans that grow on a tree, a promising crop comparatively new in California, will prove a good constituent of the grain mixture for calves. This feed is the pod of the carob, an evergreen tree highly prized in Southern Europe and the islands of the Mediterranean as feed for live stock. These tree beans are used also as a food for humans, for cooking, ground with cereals. The carob tree grows well in the central and southern coast counties of California. It may be planted on nonarable land, in pastures, hillsides, and stony and other waste places, etc., and in time yields a regular supply of a highly palatable and valuable feed for stock, without further effort and expense than the harvesting of the crop. The carob is reported to yield 300 to 500 pounds of pods per tree per annum when full grown. Before feeding the pods should be crushed with machinery for rolling barley or oats and mixed in equal proportions by weight with ground milo. Calves relish the pods greatly because of their high sugar content. The carob pods are equal to barley in nutritive value, at least as a feed for calves.

Field Notes from the Live Stock Men

Maurice Rucker has recently sold a Duroc-Jersey sow and pigs to Geo. P. Robinson.

The Roselawn Stock Farm of Woodland is consigning eight Shorthorns to the Northwestern Breeders' Association sale at Portland, Oregon, on April 3, and six to the same association's sale at Spokane, Washington, on April 5.

H. P. Eakle Jr. reports Duroc-Jersey sales as follows: R. M. Holt, bred sow; Jay Reith, ten gilts and a boar; Geo. Hayes, boar; A. S. Cowder, boar; A. Crawford, bred sow. Mr. Eakle reports his sows as having fine litters, seven sows farrowing with a total of 69 pigs.

California Breeders Sales and Pedigree Co., announces two more sales: Dispersal of Willowwood herd of 60 head registered Jerseys, owned by C. G. McFarland, Tulare, May 17; 60 head registered Holsteins; 17 head registered Percheron stallions, mares, and colts; 20 head grade Holstein and Jersey heifers. Rosamond Farm, Stalder Bros., Riverside, Cal., May 22.

H. L. and E. H. Murphy have recently sold seven registered Berkshire porkers at 12½ cents a pound. They dressed out 83 per cent, commanding a premium of 60 cents a hundred. The total price paid them for the seven was $400.08.

H. L. (Harry) Murphy returned from the East last week with 31 head of registered Shorthorn cattle. Nine of these were for W. H. Hammond, and the balance (22) for the Elder Creek Ranch. W. H. Frisselle, manager of the Tehama ranch, was with Mr. Murphy on the trip and assisted in the selection of the cattle. Mr. Murphy plans to go east again to make further purchases in a short time.

HOOKS MADE TO STAY ON LONGER

Our new patented staple and felt reinforcing device gives a *larger, firmer hold* than is possible by any other form of attachment--hence hooks do not pull off easily. This adds to life of pad. This form of attachment is

CALIFORNIA BREEDERS' SALES AND PEDIGREE COMPANY
PUBLIC SALES OF REGISTERED LIVESTOCK
THE WEST'S BEST
Jerseys
at your own price
We are instructed by Mr. C. G. McFarland, owner of Willowwood Herd of registered Jerseys, Tulare, Cal., to sell the entire herd numbering about 60 head, at public auction, absolutely without reserve or limit, on Thursday, May 17, 1917.
This herd contains some of the very greatest Register of Merit cows on the Pacific Coast, and all of them together with their daughters will be sold to the highest bidder.
There will be a splendid selection of young bulls, many out of dams with high Register of Merit records and by richly bred sires.
This is absolutely the best herd of registered Jerseys ever offered for sale in the state of California.
Catalog now in preparation. Write for one.
Sale under management of
California Breeders' Sales & Pedigree Co.

Breeding Stock For Sale

G. A. Murphy - - Perkins, Cal.

C. B. Cunningham reports a widespread interest in Chester Whites, having made recent sales in Oregon, Arizona and Hawaii. This speaks well for the popularity of California breeding stock.

H. E. Coit, Woodland, has sold his entire herd of registered Herefords at a very satisfactory price. Mr. Coil is not intending to quit the business but is already making plans to have a larger and a better herd this fall along the best blood lines in the country.

The Peters, Lamson & Walker Co. writes that with their idea of building up the finest herd of hogs in the country, they have made some wonderful importations in the last few months. Among them is Model Lady Fourth, one of the very largest type sows in the Waltmeyer herd of Melbourne, Iowa. She was 2nd at Iowa in 1916, being beaten by the sow who later was grand champion at Iowa and the National swine show and considered about the best Duroc sow ever shown. Model Lady 4th has just farrowed nine fine pigs sired by Waltmeyers Great Wonder, the grand champion boar at the Iowa state fair. 1916. We also have one of Hanks & Bishops highest priced gilts bred to Pathfinder, the boar that is rated by all the papers as the best boar of the breed today. Then we bought from O. S. Larson a Redeemer gilt bred to King The Col, the boar that has sired so many herd headers in the Middle West. We also bought a splendid yearling golden Model gilt from R. Widle which we have mated with out Grand Golden Model. This boar by Grand Model, the grand champion at Iowa, Minnesota and South Dakota is a real boar, and has been shown but once, winning first at Riverside. His litter mate showed first at Iowa this year and later defeated all the futurity winners at the various state fairs when they came to Omaha (a gilt). The smallest litter this boar has sired is nine living. He is a great big high backed boar and has the typical feet and legs of the Golden Models. He is a line bred Golden Model.

Ray C. Hannan, Tehama County Berkshire breeder, says the demand for boars is good. In the last 30 days he has made sales to V. C. Cleek, D. B. Deeter, W. B. Carpenter.

Calf Scours

Means More than the Loss of One or Two Calves

Scouring calves indicate a germ infection that is likely to run through your entire herd with serious losses.

The loss of one calf is bad enough, but nothing compared to your loss when the infection spreads, as it will unless checked. Then your profits from increase of herd are likely to be entirely lost.

The best authorities (U. S. Government and others) all agree that a thorough system of sanitation and the use of a reliable germicide and disinfectant on every farm is the only way to control these diseases. Our plan is simple, practical, costs little and is reliable. It fits into ordinary farm conditions. Our method of handling calves will promptly stop scours and finally banish it from the premises. One good calf saved will repay the expense of protecting your stock for a long time against this disease.

Our germicide and disinfectant is especially adapted to this work. It is called Bacili-Kil (B-K for short). The remarkable germ-killing strength of B-K is plainly marked and guaranteed on every package. B-K contains no poison, acid or oil. When used internally it destroys germs, heals inflamed membranes, relieves irritation, restores healthy action. B-K may be given freely in the milk and drinking water.

B-K is handy. You have in one jug your treatment for calves, cows and bull, also your disinfectant for general use. No special mixing of various ingredients; saves trouble and mistakes; insures promptness, accuracy, convenience and successful results. B-K is used so successfully by leading breeders throughout the U. S. that the demand for it has increased over 400 per cent within two years. A well-known breeder of registered stock says:

"My experience proves B-K a wonderful remedy for calf scours. I had 33 with it at one time, some too weak to stand, and by use of B-K for three weeks, I saved them all. At the end of that time all trace of scours was gone from the entire herd."

Clear and clean as water

B-K is sold by dairy and farm supply houses, druggists, general stores, etc., everywhere. If your dealer does not have it send us his name. Dealers wanted in every town.

Write us for more evidence from users and for our bulletin No. 136, "How to Save Every Calf."

Awarded Gold Medal at the Pan.-Pac.-Expo.

DAIRY SUPPLIES

759 S. Los Angeles St. LOS ANGELES

Purebred Registered

HOLSTEIN CATTLE

Tilly Alcartra, a purebred Holstein-Friesian, is the most wonderful cow in the world. In 365 consecutive days she produced 30,451.4 pounds of milk or about 15 tons. In two years she produced 60,723 pounds of milk. She holds the world's milk record for one, two, three and four years. Holstein cows hold all world's records for milk and butterfat production, but the claim of the Holstein breed to the title of the "most profitable dairy breed" is not based on individual tests. It is the great uniformity of high productiveness of Holstein cows everywhere that makes them the greatest money makers for dairymen, the world over. There's big money in the big "Black and White" Holsteins.

Send for FREE Illustrated Descriptive Booklets The Holstein-Friesian Association of America, F. L. Houghton, Sec'y, Box 120, Brattleboro, Vt.

THIS IS THE **Miller Bee Hive**

A California Redwood Bungalow Home with Clean and Dainty White Pine Furnishings

Every Bee-keeper insists that his Hives shall fit. That is just the Bee in our Bonnet, the Hive that FITS. The Miller Hive now being produced in our factory will meet the requirements of the most particular bee-keeper in the state.

Every Miller Hive part must fit. Must fit like a soft, shapely new glove, before it passes the inspector. And the furniture, cut from fragrant Shasta pine, is sure to please that particular little housemaid, the Bee.

Miller Hives are made of California Redwood, without a knot or blemish in any part. There is no variation. They are uniform.

During the month of April we are offering a special discount on all hives and parts manufactured by us.

Miller Hive and Box Co., 201-203 N. Ave. 18, Los Angeles

Swarming

Written for California Cultivator By Henry Perkins

THERE are numerous artificial means of increase but only one natural one, that is swarming. Swarming is instinctive. All efforts on man's part to eliminate it by selective breeding have thus far accomplished little. The desire to swarm is promoted largely by seasonal conditions. The outlook for honey must be good. Brood rearing must have progressed to a point that finds the colony filled with young bees and a large amount of mature brood. The appearance of queen cells in the hive is the first indication of its intention to swarm. Once a colony gets its queen cells well under way it is as difficult to prevent it from swarming as it is to break up a sitting hen. Ordinarily the colony will cast its prime swarm when the queen cells are eight to ten days old. The queen and about three-fifths of the bees comprise the swarm. The remaining two-fifths of the bees remain in the parent colony and are soon reinforced by the hatching brood.

Don't knock the bottom out of your dish pan making a noise with the idea that it will induce your swarm to light. They will light just as quickly if you are away from home. You may get busy fitting up a hive with frames and a comb of brood taken from any convenient colony. As soon as the swarm has clustered on a limb place your hive conveniently near on a box or on the ground. Then shake the swarm down in front of the hive and watch the bees make a rush for the entrance. If you watch closely enough you will see the queen making her way with the others.

It is the odor of the brood that does the trick. Bees may be hived without brood by shaking them directly into the hive but a skilled beekeeper never omits the brood and never bothers to put them in the hive.

A swarm sometimes clusters high up in a tree. In such a case one needs a round open top basket and a long ladder. Climb up to them and gently slip the basket over the cluster, then give the limb a brisk shake. If the job is well done you make take your time descending the ladder and carry your swarm where you please, depositing it in front of a hive supplied with brood as above described.

There is another advantage in using brood in hiving a swarm. If the queen should be accidentally lost or killed during the operation the bees will immediately begin constructing queen cells on the brood comb. Without brood they would have no means of replacing their queen and would soon become demoralized.

Now that our swarm is safely hived let us return to the hive from which it emerged. It has no queen but has a half dozen or more sealed queen cells which will each produce a virgin queen in four to six days. If we allow all the cells to mature one of two things will happen. The first virgin to emerge will soon destroy all the others, or, as often happens, if several emerge simultaneously the colony will cast one or more after swarms. After swarms may contain all the way from two to a dozen virgin queens.

Just as soon as they settle a royal battle begins. The workers sometimes take a hand with the result that the swarm turns up queenless. So to forestall such a calamity we will destroy all the queen cells in the hive save one. This one queen cell will supply the hive with a new queen just as effectually as a dozen could do and with the dangers of the elimination process avoided.

It is a noteworthy fact that after swarming is less prevalent among Italian bees than among other races. Seasons which promise abundant forage seem to promote it. Afterswarming is a freak of domestic beekeeping. Bees in their wild state seldom cast more than one prime swarm.

CROP REPORTS

Continued from Page 403

think the crop is shortened as there is an abundance of bloom. Some peach orchards are badly enough injured to shorten the crop very materially. This applies especially to clings; freestones are not so severely injured, and owing to the fact that there is an abundant bloom we could spare more than nine-tenths and have plenty left then.

This, I think, is the condition in a great many cases, while nearly all of the bloom is destroyed. At the same time there is often enough left to produce a crop. Of course it is impossible to tell at present how much of this that now looks good will prove uninjured, as you of course know that in a case of this kind the fruit will frequently grow until the size of a hazel nut and then drop from the effects of the cold several weeks previous. This I am afraid will be the case in many instances, although I am hoping for the best.

In the north end of the county, through the Dinuba section where many peaches are grown, the conditions are much better, in fact I see no damage to date. This condition is very often the case in this county, as it always gets colder down here in the bottom lands than it does in the Dinuba section.

It will be impossible to form any accurate estimate of the peach crop here for at least two or three weeks, although we now know that in many orchards it will be somewhat shortened.

Lester C. Reed, Simi, Ventura County

Even yet it is rather early to give a good crop estimate. From my observation 60 per cent would be a very conservative estimate. Most of the fruit on the younger trees were killed; and on some of the older trees, while others have a full crop.

There seems to be a general inclination among the growers to underestimate the crop, which in my opinion is the worst possible thing to do as you say in your inquiry "The buyers are already informed." We need information for ourselves.

Winters Dried Fruit Company, Yolo County

The last half of March was favorable to all growing crops. Previous to this we experienced unusual cold and unseasonable weather. Our usual wet month, January, was dry, no rain falling from the first of January until the latter part of February. Trees were backward in blooming, although heavily set. During the blooming period of apricots and almonds heavy rains prevailed, reducing the prospect greatly. Rainfall to date little below normal. Estimates given below are based on normal 100 per cent, and still subject to further reduction from frost, etc.

Apricots estimated at about 40 per cent of normal crop of 8000 tons green. Some orchards have fair crop, others practically nil.

Almonds: Hatch varieties light, particularly the IXL's. Drakes, and Texas look good. Estimated: Nonpareils, 30 per cent; IXL's, 20 per cent; Neplus, 40 per cent; Peerless, 50 per cent; Drakes, 100 per cent; miscellaneous, 75 per cent.

Peaches: All varieties look well and show good prospect with the exception of Tuscan Clings. Estimated: Muirs, Lovells and Yellows, 100 per cent; clings, 33 per cent.

Prunes: Trees now in full bloom, prospects for good crop. Small acreage in this district.

Shipping Plums: Prospects good.

Boys and Girls Send in Your Names!

WE GIVE AWAY SHETLAND PONIES

This is the Easiest and Best way to get one. Any Reader may send in the name of any boy or girl.

The Best Pet and Playmate any Child Can Have

Wouldn't you like to have us send you a fine pony like this?

Just the Prize Every Boy and Girl Wants Most

How to Get a Shetland Pony

The California Cultivator, the big agricultural and live stock weekly of California, is going to give away some more Shetland ponies, and you might just as well have one as anybody. Send in your name and address today so we can tell you all about it. It costs no money to enter or take part. Already the Pony Man has given away 151 Shetland ponies to boys and girls for doing a little work that you or any boy or girl can easily do during spare time. Many other boys and girls say it is easy, and I believe you will say it is too.

These Shetlands we give away are fine, valuable little horses, all trained for children to ride and drive. Read the letters we are printing and see what the other boys and girls say who have won our prize ponies.

A Shetland pony is the nicest pet and playmate any child can have. They are fine to ride and drive to school for they are perfectly safe and by nature are great pets and very strong, useful animals, too. Many boys and girls who have to walk to school have sent to California Cultivator for a Shetland pony.

The Pony Man had never heard of any of these other boys or girls until they sent him their names and addresses so he could write and tell them how to go ahead.

Three more fine Shetlands and outfits will be given away Thursday, May 31, 1917, to boys and girls who do some work for us that will be easy to do. The sooner you send in your name the sooner you can get started.

Each Pony Is Gentle and Broken to Ride and Drive

These Ponies Are Fine to Ride to School

A PRIZE FOR EVERY BOY AND GIRL

And here is another important point. If you send us your name and address at once you will be entitled to take part in the Extra Prize Awards and you can sure earn a fine camera and gold watch or other valuable prize. You cannot lose, everyone taking part will receive a prize or cash for the work done.

"King," a beautiful young Shetland and pretty outfit consisting of a fine four-wheeled pony runabout and nickel mounted leather pony harness is the first prize, and that is the one you want and you might just as well have "King" as anybody. Send us your name and address right away so you can get started at once and get a pony for yourself. Besides "King" we are going to give away two other fine Shetlands, "Stepper" and "Beauty", and a pretty saddle outfit with each one. As soon as we hear from you we will send you pictures of other boys and girls and the ponies they got and tell you how to go ahead. If you already have a pony and know some other boy and girl who would like to have one, please tell them about these ponies we are going to give away.

WAS OFFERED $200 FOR HIS PONY AND OUTFIT

Here is a letter from Earl Frederick, who won first prize pony and outfit about a year ago. He was offered $200 for his prize, but would not sell it. "King" and his pretty outfit are just as nice as Earl's pony and outfit. Here is Earl's letter:

"Dear Pony Man: I received 'Bingo' and the buggy and harness which I was fortunate enough to win, and I am well pleased, as it is a better outfit than I really expected. I have been offered $200 for it, but of course it is not for sale. I want to thank you for it and advise any boy who wants a Shetland pony to enter and work and earn one, for it is sure a pleasure to ride or drive a pony like the one I got. I will have my picture taken with the outfit and send you one. Again thanking you, I remain, your friend,

EARL FREDERICK."

DELIGHTED WITH THEIR PONIES

I have already given away 151 Shetland ponies and pony rigs to boys and girls and if you haven't a pony now is your time to get one. You will be just as well pleased as the others. I have not the space here to print all the nice letters the boys and girls have written me, but I will send many more when I hear from you. Some have been offered $200 for their ponies and outfits, and would not accept it, so you see these are valuable prizes we give away.

Rialto, Cal., December 27, 1916.

Pony Man, California Cultivator.

I take pleasure this morning in writing you a few lines for Percy, thanking you for the nice prizes he received. He certainly was delighted with them. If the other contestants were as pleased as Percy they certainly were a happy lot on Christmas morning. Yours truly,

MRS. W. F. FOWLER.

TAUGHT HIS PONY TRICKS

"I am sending you a picture of myself and 'Colonel' and his outfit. I was sure glad to get him, for I think him peaches and cream. He drives fine and I ride him also. He will lie down, shake hands, jump over a stick, stand on his hind legs, and try to do most anything I tell him. He seems to understand what I say. Again thanking you for 'Colonel' and outfit, also those who took the paper, I remain, "ELMER LINDSAY."

WINNERS OF OTHER PONIES RECENTLY GIVEN AWAY

Beulah DeWitt, Ventura County.
Raymond Moyer, Riverside County.
Margaret Rae, San Bernardino County.
Marguerite Rinn, Sacramento County.
Gertrude Fawcett, San Joaquin County.

WINNERS OF PONIES GIVEN AWAY MARCH 24, 1917

Earl McAllister, Kern County.
Torance G. Spike, Jr., Fresno County.
Verna Cole, Ventura County.

Marina, Cal., January 14, 1917.

Dear Pony Man:

I am very much pleased with my watch. It keeps accurate time. I have only had to set the hands once. I feel very well rewarded with it for the little work I did for you. I feel as though I have not done enough for you. I would like to enter any other campaign that you have, so please let me know about it.

Very truly,
THOMAS SAMUELS.

Sacramento, Cal., February 12, 1917.

California Cultivator, Los Angeles.

Dear Sirs—I wish to thank you very much for the way in which you conducted the recent campaign in which I took part. Your paper is very well known throughout the country which makes soliciting much easier and encourages one to work harder. The system you have in keeping the contestants informed as to their standing could not be improved upon.

I worked as hard as I knew how and although I was not fortunate enough to carry off the first prize I am very well satisfied with the second, which at present I would hate very much to part with.

The pony is just great. I am growing more fond of her every day and she is as gentle as a kitten. So far I have been riding her but as she either drives or rides I intend to get a small cart so that I may give some of my interested friends a ride.

Again thanking you for your kind treatment during the contest and dandy pony and saddle I received, I remain Yours very truly,

JACK HENDERSON.

Letters to a Beginner

Written for California Cultivator By Jean A. Koethen

WATCH THE MITE

DEAR George:—Did you ever go out to the chicken house on a warm spring evening to take a broody hen from the nest? And did you, after you had come in and were seated by the shaded lamp to enjoy the evening paper, begin to feel a mysterious crawling on your arms and your neck? Did you call on each member of the family in turn and finally on all together to hunt and catch the mysterious crawler on the back of your neck before it hid in your hair? If you did, you know a little, just a little, of the agony a chick endures when it is persecuted by the little red mite, an enemy so small you can hardly see it, so clever a hider that you cannot find it in daylight unless you know exactly where to look.

Now just multiply the dozen mites that crawled onto your arms when you handled the hen by 100,000, and put them on a chick that weighs at the most one-three hundredth part of what you do, that has no family or friends to hunt and kill the creatures and is absolutely powerless to reach them, even if it could see them—put that million of mites on one poor little helpless chick and let them crawl and crawl and crawl, not for an hour or so, but all night, and not for one night, but night after night, would you think it strange if the chick, unable to get a minute's sleep, should begin to droop? And if those million mites were not only crawling as they did on your neck, but biting, as they never do on us humans, sucking the blood of the poor little chick night after night till it had hardly a drop left, would you think it strange if that chick some night gave up the struggle?

Careless feeding and overcrowding kill their thousands every year, but the mighty mite kills its tens of thousands. I am amazed again and again at the number of people who tell me. "We have no mites". Yes? And how do you keep them off your premises? "Oh, we don't do anything. We don't have them." Now, George, as a practical poultryman you know better than that, of course. You know that mites are never long absent from any plant unless precautions are taken to keep them out, and you are painting your houses every week or so with kerosene and crude carbolic acid. That is all right, but are you sure you know what to look for and where to look in your brooders when the chicks begin to look tired and droopy?

One year when Dorothy and I were raising chicks in an outdoor brooder we were much mystified by the evident presence of mites. The chicks were droopy. We painted and cleaned, and still the chicks drooped. Finally it occurred to me to look under the strip of asbestos which protected the top of the hover, and there we found them, millions and millions of them. Do you know what they looked like? One doesn't look for anything large when he is looking for mites. These looked like nothing so much as the grayish dust that surrounds or belongs to (I hardly know how to put it) a cobweb. Yesterday, as I was brushing down cobwebs in the feed house I came upon one that looked so much like a nest of mites that I had to rub it with my finger to make sure. This is the test: If you put your finger on one of those grayish patches, and on removing it can see nothing move and feel nothing move, it isn't mites. If something crawls, look out.

Well, when we saw that grayish dust under the asbestos of the brooder, we knew we had our work cut out for us, for the creatures have a trick of burying themselves in cracks and even in the interstices of a wooden board, which is very annoying. We took off the asbestos and washed and painted. I rather think we used boiling water that time before we put on the kerosene and crude carbolic, for boiling water is very effective if only it reaches the mites, and we painted with the disinfectant more than once before we dared put the chicks back in the brooder. I never felt quite easy about that brooder afterward, for there is nothing harder than getting out mites once in, but we kept washing and painting, and if the mites were there they never dared to come out.

You might suppose they would starve to death if only the surface of the wood were kept saturated with disinfectants, and I suppose they would in time, but it takes a long time. A brooder or coop that has once been infested must always be watched. That is why I prefer, for my hen-mothers and their broods, to buy clean new boxes every year or so for coops. A good, solid dry goods box, such as you can buy for 50 cents, makes a splendid brood coop. The first season, if you are careful and use disinfectants freely, you will probably keep the mites out of it. The second, you will need to be more watchful, and when this season is over you can split the box up for kindling.

Raising chicks as you do in lots of from 600 to 1000 you cannot employ this simple method of evading mites, and so you will have to be doubly watchful. If your brooder house is freshly whitewashed on the outside every spring before you put chicks into it, it will be easier to keep them out, but it is only by thorough cleaning and disinfecting between hatches and the greatest watchfulness while the chicks are in the house that you can be sure it is clean.

I spoke of the mite as gray, but this is only when it is empty. As soon as it begins to feed on the blood of a hen or a chick its color begins to brighten, and when it is full it is a deep red. Perhaps this is why a good many people have trouble in recognizing them. They are looking for something red and so do not notice the little gray spot which, when you see it on your arm, can hardly be distinguished from a freckle.

If the little red mite could only be eliminated California would indeed be the Poultryman's Paradise it has sometimes been called. As it is, early hatching is a great help in its elimination, for these pests do not breed in cold weather and are far more troublesome in May and June than in March and April. If you get your chicks out early the mites will have comparatively little chance at them and you will save yourself a lot of trouble.

Affectionately,

Aunt Jenny

The "Egg Bill"

Written for California Cultivator By C. A. Wilkins

A HEARING on Senate Bills 462, 463, 464 and 565 was held in the senate agricultural committee rooms on March 27 to give the proponents and opponents an opportunity to present the merits and demerits of the bills. These are known as the "egg bills" and have been discussed in previous issues of the Cultivator.

Former Assemblyman Knox Boude of Sebastopol; Howard Hansen of Penn Grove; J. M. Abeel of Sebastopol, and the writer appeared as proponents.. Opposition to the bills, with the exception of 462, was presented by Wm. M. Foley, secretary of the California Master Bakers' Association.

Foley contended the legislature has no right to enact legislation requiring the manufacturer to state the contents of products offered for human consumption; that inspection of imported eggs under the federal government and the state board of health makes it unnecessary to pass further legislation.

Hansen, Abeel, Boude and others contend the bills are health measures and the public has a right to know the character of any product offered by manufacturers, citing the provisions of state and federal laws requiring the labeling of food products containing preservatives, etc.

Senate Bill 464 regulates the sale of eggs which have been in transit more than 31 days. Eggs of local origin may be held in storage 30 days and still be sold as fresh. If kept in storage 31 days or longer they must be sold as storage. Why then, say proponents of 464 should imported eggs that have been in transit covering a period from 31 to 42 days, often under most unfavorable conditions, be allowed to enter California and be sold as fresh eggs? These are largely Oriental eggs, and around this point considerable discussion developed.

No action was taken at the hearing, the opponents of the bills asking permission to submit evidence in reports of the University of California and photographs of poultry raising in the Orient, to prove that imported eggs are produced under sanitary conditions and as good as California eggs.

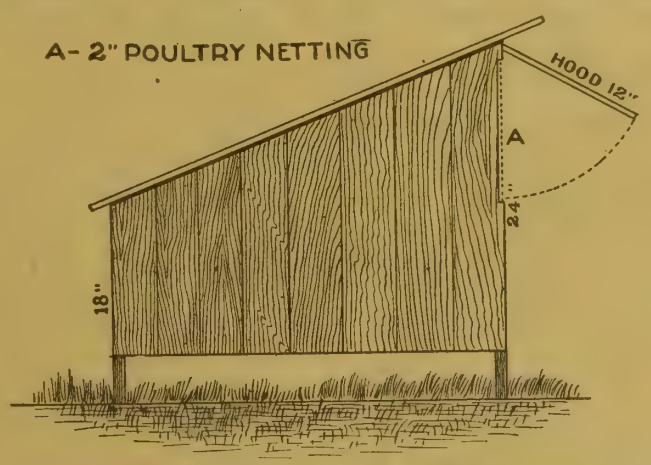
Comments on "Thirty-One Cents Profit"

By Henry Langenschwadt

After reading the poultry articles in the Cultivator of two weeks ago (March 10, Page 296), I would have liked to have written you had I the time then. How true they were to facts, and I wish more matter like that could be kept before the reading public instead of so much that we find in the journals.

I do want to express myself about the article you have in last week's issue, March 22, "Thirty-one Cents Profit per Hen in February." To me this is misleading. It puts one under a false impression because facts are only half stated. Practically only one cost item is taken into consideration (two if you count the egg cases mentioned) viz., the feed necessary to produce the eggs. How about the plant, interest on investment, taxes, depreciation, repairs, growing green feed, superintendence, cost of growing hens, loss in value when egg laying capacity ceases, death in flocks, and other items which should be reckoned before profit can be determined. I would not be surprised if all cost items were considered this 31 cents would figure down to about one-third that amount.

I should say from my experience that one man doing this work alone must go some. He will have to be a good man that cannot be secured every day. Yet the writer says that one man can care for three or four times as many hens. Eggs in February were higher in price this year than they ever have been to my knowledge. The average egg yield in previous contests for February is given as 12.8, this February 16.3. Remember these hens are the cream (yes very cream) of 50 or 60 flocks. How about the labor involved and cost of producing and selection, and so on? I could not help calling your attention to my viewpoint of this article.



Coop for Chicks Just Out of Brooder
—From Mrs. Koethen's Poultry for Profit.

THE NEXT STATE POULTRY SHOW

The Coalinga Poultry Association has been given the third annual state poultry show, to be held November 14-18, inclusive (dates not definite). This also will be the fifth annual show of the Coalinga Poultry Association.

In the application of Coalinga Association $425 in gold specials is offered in addition to the regular cash premiums in all classes. This amount probably will be greatly increased.

Regular premiums will be paid on singles as follows: first, $2.50; second, $1.50; third, $1.00; fourth, 50 cents. Pens, first, $7.00; second, $5.00; third, $2.00; fourth, ribbon.

The state show committee of the Coalinga Association consists of C. T. Walker, W. T. Zimmer and T. P. Smith.—By C. A. Wilkins, Secretary California State Poultry Breeders' Association.

CHEAP GAINS ON POULTRY

It is just as important to fatten chickens sent to the market as it is to fatten hogs or beef cattle. In fact, when the chicken comes from the range it is in the proper condition to put on economical gains. Students in the poultry department of the University of Missouri found in recent tests that chickens will gain about 23 per cent in 12 to 14 days' feeding. That this gain is economical was shown by the fact that the grain required to put on a pound of gain was approximately three and a half pounds.

The total cost of a pound of gain with corn meal at $2.25, bran at $1.50, middlings at $1.75, and sour milk at 20 cents a hundred pounds, was eight cents. Even at the present high price of feeds, economical gains can be made.

The ration consisted of corn meal, seven pounds; shorts three pounds; and bran one pound. To every pound of this mixture two pounds of sour milk was added. This wet mash was fed twice daily. The length of the feeding period, which was ten minutes the first day, was increased a minute a day as the period advanced. The chickens were confined in coops two by two and a half feet square, each coop having a wire bottom. Slats were placed up and down, one and a half inches apart, permitting them to reach the food which was placed in a trough outside. The close confinement not only discourages exercise, thus promoting gain, but the inactivity causes the tendons to soften. The fat is distributed through the muscles by the fattening process and the result is a luscious flesh which comes only in a finished product, put on cheaply.

• • ALFALFA SEED • •
As has been our custom in the past, we are offering alfalfa seed both retail and wholesale. This is tested stock and up to our usual high standards. Samples, prices, etc., on application. Wire, write or phone V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.
• ALFALFA SEED OUR SPECIALTY •

Alfalfa Seed—Common variety. Smooth Peruvian and Hairy Peruvian, good quality, excellent color, high germination test, grown in Arizona under ideal conditions. Do not buy until you have compared my samples and prices with seed others offer. E. F. Sanguinetti, Yuma, Ariz.

Seed Beans — We sell direct to the grower. Buy now before the advance. Our stock is carefully selected. Satisfaction guaranteed. Tell us the nature of your soil and we will suggest the best variety. Modesto Farmers' Union, Modesto.

Giant Winter Rhubarb Plants. Big profits. From ⅝ acre first season after planting I sold 675 boxes rhubarb, receiving $673.70. Grand prize San Diego Exposition. Big discount on plants for prompt orders. Booklet Free. W. A. Lee, Covina, Cal.

For Sale—The very best seed corn, white or yellow. Selected for years. Makes large uniform ears. Chas. McNeely, Alpaugh, Cal.

The "Himalaya", best blackberry; enormous bearer. Splendid shipper. Strong plants 50c dozen, postpaid, $20.00 per 1000. Louis Bahrs, Loomis, Cal.

Alfalfa Seed—The very best, guaranteed 16c. Wm. Stuthman, 1239 West Pico St., Los Angeles, Cal.

Nurserymen—Pot grown conifers, palms shrubs and ferns for lining out or potting. Ballou's Nursery, Pasadena, Cal.

Alfalfa Recleaned—Old tested kind, 14c pound in ton lots. Grown by me. H. Garrison, Murrietta, Cal.

Sudan Seed—Pure, extra heavy; $4 10 lbs., $35 cwt. Amarillo Seed Co., Amarillo, Texas.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, report for the twenty-first week ending March 27, 1917.—The hens in the contest at Storrs have now laid a grand total to date of more than 50,000 eggs and the best part of it is that this point has been reached a week earlier than it was last year and they are still gaining. The total yield for the twenty-first week amounted to 4423 eggs, a jump of nearly 200 over last week's figures and nearly 100 eggs better than for the corresponding week a year ago.

In addition to a better average yield in the current competition there is also a better pen record. In the contest now running a pen of Leghorns stands first with a total score to date of 884 eggs or 30 eggs ahead of the English Wyandottes that were leading last year at this time; this pen is over 300 eggs ahead of the best Leghorn pen at the corresponding date a year ago. All of this seems to warrant the prediction that the flock of hens now at Storrs need not fear the pace that has been set by their predecessors.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Fairfields Poultry Farms, 722; Jules F. Francais, 602; Merritt M. Clark, 565.

White Wyandottes

Merrythought Farm, 746; A. L. Mully, 664; Brayman Farm, 644.

Rhode Island Reds

Jacob E. Jansen, 742; Geo. W. Harris, 702; Allan's Hard to Beat Reds, 689.

White Leghorns

A. P. Robinson, 884; J. O. LeFevre, 728; Hilltop Poultry Yards, 716.

Miscellaneous

Obed G. Knight (White Orpingtons), 662; Cloyes & Sullivan (Buff Wyandottes), 641; Holliston Hill P. Farm (White Rocks), 617.

The acreage planted to early potatoes in the southern states is estimated by the United States bureau of crop estimates to be 17 per cent greater than last year.

DEVELOPMENT BOARD MEETING AT STOCKTON.

The annual meeting of the Counties Committee of the California Development Board will convene in Stockton, Friday morning, April 13, at 10 o'clock for a two days session. Matters of great importance will be discussed, and it is hoped that the attendance will be large. Special entertainment features are being planned by the Stockton Chamber of Commerce. These, together with the program, will be announced later.

TAX COMMISSION

The report of the tax commission of the state of California of investigations covering the period of the past year is being mailed from the state printing office. It is a book of 280 pages filled with information of interest to every taxpayer, and as taxpayers in California are some tax payers we doubt not this report will have very general reading. Of course the aim of the commission is to make more equitable distribution of taxes. If it could go farther and make a reduction in the amount required to conduct the affairs of state, county and municipality, it would surely be called blessed.

SULPHUR NOW

The early sulphur catches the fungus. It is none too early to have sulphur in hand with best improved bellows or distributor for economical use in the vineyard. Lacking such appliance use the sack, but be sure and sulphur for it has been shown where mildew has full sway black rot and other troubles also come. Save the crop and save the vine.

THE NEW GRAIN STORAGE SILO

Forty-three miles north of Los Angeles, in the edge of Ventura County, on a ranch facing the concreted coast highway or Old Conejo road, there is being built a battery of four large cement silos of surpassing interest to dairymen and beef cattle men. The problem which Mr. H. H. Braly, the manager of the ranch, is solving is a double one.

The Conejo Ranch produces a large amount of grain which is all fed to their hogs and cattle. The sacks necessary to contain the grain would cost the ranch nearly $3000 this year alone, and there is no need of having the grain in sacks as it can be handled to better advantage loose. The Janss Investment Company, of which Mr. Braly is vice-president, has let the contract for the erection of four Monolithic Concrete Silos, 20 feet in diameter and 40 feet high, to be reenforced sufficiently to hold loose grain as a grain elevator. The silos are being built so that it will be possible at a later time, when they are being used as silos, to continue them to a height of 60 feet if desired. This year three, and possibly all of the four, will be used as grain elevators, but it is anticipated that within a year or so they will all be used for the original purpose of conserving corn in silage form. Mr. Braly realizes that even with his wide pastures and abundant grain harvest he cannot afford to overlook the economy of corn ensilage. He is therefore saving the high cost of grain sacks this year and providing for the future economy of corn ensilage feed.

As far as can be learned this is the first time that silos have been built for the additional purpose of grain elevators. W. L. Jencks of the Artesia Lumber & Cement Co., is the designer and contractor.

ROSIN SPRAY

The Cultivator has often referred to the value of the old-time rosin spray for controlling scale insects and called attention to the fact that particular care is needed in the making of this spray. Now comes the Pacific Soap Company of Los Angeles and announces "P. S. C. Rosin Spray." This is simply rosin, fish oil and a caustic cooked together in such a way that a solution in hot water or, if desired, even in cold water, is possible. It is needed for mealy bug, rose scale, aphis and many other insects. Further information may be had regarding this spray by writing the manufacturers.

Household Department

THE SCARECROW

It was a regular scarecrow man,
Made on the old and well-known plan—
A cross of sticks in a garb forlorn,
That stood on guard in that field of corn.
And, indeed, it made the old farmer smile
As he put it up and whittled the while:
It would look to the crows so very ferocious,
So truly astounding and atrocious,
That it tickled his fancy to think how they
Would catch a glimpse and flutter away.

Well, two black crows sat on a tree,
And the young crow said to the old one, "See.
Now what is that frightful thing out there?
It's enough any honest crow to scare!"
But the old crow chuckled and then looked wise,
Shook in his feathers and winked his eyes;
Something tickled him, but if 'twas a joke
His voice didn't show it a bit when he spoke.
As, looking down at the younger crow,
He said: "What is it? Ah! don't you know?

"Why, that, as we wise ones all suppose,
Is the special patron saint of the crows!
We watch for his coming every year
To tell when the Feast of the Corn is here.
See how he stands with his arms stretched out!
He is calling the crows from all about!
Such a kind invitation is most alluring—
So very cordial and reassuring!
I think we had better accept—don't you?"
And down to the field of corn they flew.

—Wallace E. Mather.

THE STAND-BY HEN

Written for California Cultivator
By Alice Palla, Linne

I'M going to take the hen for my "meat recipe". There may be some meat product cheaper, but the hen and her by-product, the egg, are always with us on the farm. It is difficult in this warm climate to have home grown fresh beef. Pork is cured and kept much easier. But pork is a good price and sometimes not enough is saved and cured for the summer's use. Then comes the poultry and eggs—always ready in an emergency. Even bacon and ham seems more satisfying accompanied by eggs. Young chickens to fry in season, hens to boil, bake, to make pot pies—and our "national" bird, the turkey. And as a neighbor said, when we have not anything else ready we just cook eggs. This means on the farm.

In buying for economy the cheaper cuts of beef, carefully cooked and with the aid of a good meat grinder can be made palatable and nourishing. Always do your own marketing. Pot roasts and boils cost us here 15 cents per pound at meat shop; pork sides, 15 cents, best bacon from 28 to 35 cents. Getting a nice piece of side, salting slightly, it will keep well and is quite a saving. Lard in pails at stores sells 20 cents per pound. Rendered beef suet at shop 10 cents per pound. Five pounds of suet, one quart salad oil (cost about 30 cents and weight about two pounds) mixed, makes a very good cooking preparation at a saving. Here are two chicken recipes we like very much—one a "left over".

Chicken with Dumplings

Take a good fat fowl, one year old, joint and boil tender. Season to taste. Have sufficient broth to more than cover meat as the dumplings will absorb broth.

Dumplings—One well-beaten egg, pinch salt, one small cup sweet milk, one tablespoon butter (level measure), two rounded teaspoons baking powder, sifted through pint flour, stir with spoon. Add enough flour to make stiff dough; drop small tablespoons in kettle of boiling meat. Cook about 20 minutes, closely covered.

Chicken Croquettes

One quart cold boiled chicken chopped, two level teaspoons salt; two tablespoons chopped parsley, one tablespoon minced onion, a dash of red pepper to suit taste, mix thoroughly. Put on fire a pint of milk, add two tablespoons butter, two tablespoons flour rubbed to smooth paste. Cook and stir until smooth and thick, add chicken, mix well, turn out to cool. When cold form into croquettes; dip in egg, roll in bread crumbs or cracker crumbs and fry in hot deep fat crisp brown.

IRISH STEW WITH VARIATIONS

Written for California Cultivator
By Nita Ferris, Woodlake

BUY a pound and a half of mutton or lamb from the neck and have it cut in neat pieces of a convenient size for serving. A little of the fat from the meat, or two tablespoons of butter are melted in a frying pan and two large onions sliced and fried a bright brown. They are then removed to a deep kettle and the meat well floured and dropped into the fat to brown nicely on all sides. When it is well seared it is placed in the deep kettle with the onions, then two large carrots, pared in quarters, lengthwise and browned in the fat and two large white turnips or three of smaller size, and two parsnips, are treated in the same way. All the vegetables are added to the meat and three pints of hot water are poured into the kettle which is placed on the hot part of the range and brought quickly to the boiling point. Then the heat is lowered until the stew merely simmers. "The pot should smile, not laugh" is a good rule to remember. After the simmering has continued for an hour a teaspoon of salt is added, a salt spoon of pepper and a pinch of celery seed or celery salt. Four large potatoes are pared, cut in quarters and placed in very cold water for half an hour and dropped into the stew when it has been cooking very slowly for an hour and a half. If by any chance the gravy has cooked away I add a little more water when the potatoes are put in to cook, for plenty of gravy is one of the chief delights of the stew. The cooking may be a little more rapid after the potatoes have been added, for they must not be allowed to soak or become waxy. When they are tender the stew is finished. It should be just thick enough and of a delightful, nutty brown color. Take up the meat on a hot platter and group the vegetables around it. The onions, except for the delicious flavor, will have disappeared. Taste the gravy and add more seasoning if necessary.

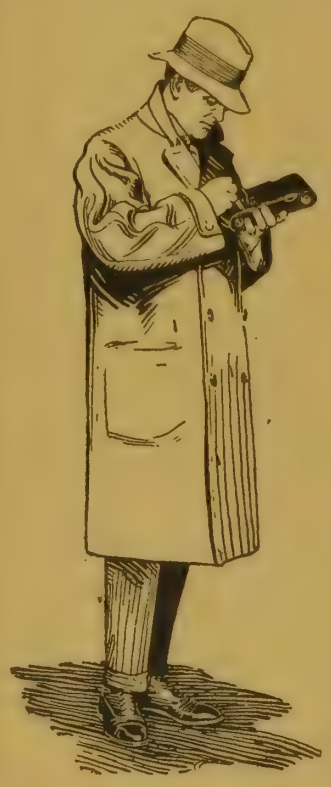
Hungarian Goulash

One pound of lean veal, half a pound of lean beef, and one-fourth pound of salt pork is used. The veal and beef are cut in neat blocks and the pork in small pieces and the latter fried brown. Then a large onion is sliced fine and fried in the fat until a deep brown, when it is removed and discarded. Next the meat is well dredged with flour and seared in the fat till nicely browned and placed in a casserole, sprinkled generously with paprika and covered with three cups of boiling water, the cover placed on the casserole and put in the oven.

Meanwhile six small white onions are peeled, three turnips pared and cut in balls with vegetable cutter, four potatoes and three carrots, also shaped with cutter, and when the meat has simmered an hour these vegetables are added to it. For flavoring add half a bay leaf (no more), one clove, a small chopped green pepper and a teaspoon of Worcestershire sauce, teaspoon salt and a sprinkle of white pepper. The goulash is then allowed to simmer in a moderate oven for an hour and a half longer, served in the casserole with the gravy thickened slightly if necessary.

French Ragout

Two pounds of veal from the shoulder. The meat should be nicely trim-



Those things that need your attention on the farm:

You, Mr. Farm Owner, who are about to make your first trip of the season to the farm, will find a score of things that need attention. Whether it is rented or "worked on shares," or whether you employ a superintendent, you, *the owner*, have certain things that you want done, will order done. And you want a record of how things look now:

Certain old fences. *The foundation to the corn crib.*
The south porch. *The broken hoops on the silo.*
The land that needs tiling. *The condition of the orchard.*
The condition of the horses and cattle and hogs.

And one obvious thing to do is to make an auto-photo-graphic record. Make pictures of the things that don't please you, as well as pictures of the things that do please you. And alongside of each picture make a brief memo,—at least a date and title, an authentic, indisputable record written on the film at the time. It's a simple and almost instantaneous process with an

Autographic Kodak

Catalogue, free, at your dealer's or by mail.

EASTMAN KODAK CO., 473 State Street, ROCHESTER, N. Y.

med and cut in two-inch cubes. Dip them lightly in flour and brown delicately in butter, turning them until all sides are of a golden tint. Then sprinkle them lightly with two tablespoons of flour, a salt spoon of salt, and half a saltspoon of pepper. Cook gently until the flour is brown, then add two cups of water and cover closely. Peel four carrots and cut them in dice (I use a vegetable cutter for this purpose), and peel and slice three onions, cut one or two sprigs of parsley into bits, also the same quantity of chervil and add these to the ragout, cover and simmer closely for an hour and a half. Add two cups of peas, drop in four potatoes, pared and cut in dice or balls. A little more water may also be added if necessary. Stir now and then, but keep the ragout closely covered between stirrings. Serve on a hot platter garnished with watercress and toast points. I am sure when you eat this French cousin of the Irish stew you will say, as many have said before you, "Antoinette did not live in vain."

Spanish Stew

One pound and a half of round beef, cut in large cubes and when you are ready to make the stew place the pieces on the board and with a mallet pound them until they are quite ragged. While pounding the meat sprinkle it with flour from time to time, taking care that as much as possible is absorbed. Then brown the meat in a little butter or fat, turning it so that all sides may become nicely seared. Pour two cups of strained tomato juice over it and add two sweet green peppers and one large onion chopped fine, cover and cook very slowly for an hour. Add half a pimiento (the canned pimiento will answer very well) cut in bits, season with salt and a little pepper and simmer for ten minutes longer. Serve on a hot platter garnished with parsley.

SOME SUGGESTIONS FOR COOKING THE CHEAPER CUTS OF MEATS

Written for California Cultivator
By M. E. K.

OWING to the advance in price of meats, most housekeepers are eager to find the meat that goes farthest" lest the members of their families become vegetarians with the eyes of desire still on the flesh pots.

All meat is so high that it seems almost unreasonable to talk of cheaper cuts, but there is a greater difference in price that the uninitiated would think. For instance rump roast, quoting from my local market, comes at 17½ cents per pound, cross and prime rib 20 cents, while flank and short rib can be had at 12½ cents per pound.

Of course the roasts are cheaper than frying meats and go farther, and of the roast varieties I think most cooks will agree that the pot roast is best if you wish a nourishing, appetizing meat at the least cost.

The cheaper cuts used for pot roast, such as chuck and flank, can be made just as savory and attractive as the more expensive cuts if care is taken in the preparation. The point is that they must be cooked very slowly in order to soften the connecting tissue. They give opportunity for extending the meat flavor, of which most of us are so fond, to cheaper kinds of protein food. This is done by combining with macaroni or what my family likes best, a good dressing.

The following recipe for preparing flank roast is a favorite of mine. I use it during hot weather or when for any reason, it is desirable to prepare the roast the day before it is to be served:

Four pounds flank roast, half loaf stale bread, one egg, butter size of walnut, half onion, salt, pepper, sage to taste.

Place kettle over hot fire and put in one tablespoon shortening. Brown the roast in the grease on both sides, then pour over hot water to partially cover. Cook over slow fire until tender, adding more hot water when necessary. Salt when meat has cooked one hour. When roast is tender take from fire and place on meat board, removing the bones.

Crumble the bread and make a dressing, moistening with the broth from the meat, add beaten egg, butter, finely chopped onion, salt, pepper and sage to taste. Put in baking dish, pour about it the remainder of the broth, cover and bake half an hour. Spread the cooked dressing on the flank and roll up, tie with cord or strips of muslin, put under weight and let stand over night. When ready to serve cut in thin slices, garnishing platter with lettuce leaves. It is delicious served with mustard or a tart sauce.

This is also excellent as a hot roast. In that case as soon as dressing is prepared roll as above and bake for half hour, basting with the broth.

THE FIRELESS COOKER FOR CHEAP MEAT

Written for California Cultivator
By Mrs. E. V. Henderschot, Van Nuys

ONE'S meat bill as well as one's fuel bill may be greatly reduced by the use of a fireless cooker. The coarser, tougher parts of the beef may be cooked in this and rendered tender, juicy and delicious.

Purchase four or five pounds of neck meat, the cheapest part of the beef. Rub with salt, pepper and a little butter. Put into the fireless cooker with very little water. In the morning look at it to see if it is tender. If it is not, reheat the cooker and put the meat in again, leaving till just before dinner. It may then be served hot from the cooker or browned in the oven. Thicken the juice left in the cooker vessel. It will be much more delicious gravy than that from meat cooked on top of the stove.

Take part of the meat left, run through the chopper, boil with corn meal or cream of wheat porridge, let stand over night and fry a nice brown for breakfast.

The rest of the left over meat together with any other scraps of bacon or ham may be made into a palatable meat pie or loaf. For the pie, chop the meat into rather small pieces, put into kettle with any cold gravy that is left. Add water, a small onion chopped fine and a piece of bay leaf. Simmer gently till the onion is soft. If the gravy is very thin, thicken with flour rubbed smooth in water. Turn into baking dish and cover with rich biscuit dough. Bake in the oven until the crust is golden brown.

For the loaf run the meat through the chopper. Add half cup bread crumbs for each cup of meat. Bind together with an egg or some milk. Add salt and pepper. (Some also add sage and a chopped onion, but we prefer the loaf plain, serving with a spicy tomato sauce). Form the meat into a loaf, sprinkle with nutmeg and bake with one-half cup water and two teaspoons butter in pan.

For the tomato sauce, chop one onion and one carrot or green pepper fine. Fry in one tablespoon of butter. Stir in all the flour the grease will take. Add half cup tomatoes and the juice from the loaf. Drop in a piece of bay leaf, two whole cloves, salt and pepper. Let cook about half an hour. Remove bay leaf and cloves. May be strained or served with the pulp in it.

ECONOMICAL MEATS

Boiling Beef

The meat from which we derive the most benefit is a cheap boil. Put it on in enough cold water to cover, skim well when scum has raised, then boil slowly until very tender, salting when partly done, to suit taste. If you have kept plenty of water on meat while boiling you have a nice lot of broth or stock, which I use in different ways. Sometimes I take a part of it and just a little of the meat cut fine, and mix with stale bread, sage, and other seasoning and bake in moderate oven, making a delicious dressing. Thicken the remainder of stock for gravy.

Again I make a dumpling of a cup of sour milk, a scant quarter teaspoon baking powder, salt and enough flour to make it thick enough to drop from a spoon. Boil in a part of broth ten minutes; not too long or they will be soggy.

Sometimes I boil potatoes with the meat, save part of broth, and for another meal skim off most of fat and boil one carrot, one onion, one-half

To Light Your House and Barns

To Cook Your Breakfasts and Dinners

Union Carbide Gives Your Country Home This Two-in-One Service

CARBIDE LIGHTS are as brilliant as the cities' best – they shine from handsome bronze fixtures – they are commonly equipped to turn on without matches.

CARBIDE COOKING RANGES are just like city gas ranges – they furnish heat on tap – instantaneous – steady – uniform heat, without kindling, ashes or fuel to handle.

Fifty pounds of UNION CARBIDE will run a single CARBIDE LIGHT AND FUEL PLANT for weeks.

Without attention the plant will automatically "feed" the range in your kitchen, and as many lights as you care to install in your house and barns.

The beauty and convenience of the light will double the charm of your fireside hours – and the modern gas range will bring relief from kitchen drudgery to the woman who cooks your meals.

During the past fifteen years these CARBIDE Lighting and Cooking Plants have been tested, by country home folks, in competition with hundreds of different lighting plants invented during the same period.

While most of this army of lighting plants have lived a day and fallen by the wayside, the CARBIDE Plant alone has survived and gained steadily in popularity.

One and all, the hundreds of thousands of CARBIDE Plants now in use are practically indestructible – they last most a lifetime.

Instead of daily attention, the CARBIDE Plant needs monthly attention – instead of constant repair, it needs none at all – instead of a single service, it furnishes double service – two in one – twice the value for your money.

We would like to answer any question about the CARBIDE Plant you care to ask – we can send you too, if you wish, with our compliments, intensely interesting Booklets telling you why the light flame is the coolest of all – and the cooking flame the hottest – why the light is called artificial sunlight – how it grows plants the same as sunlight – why the UNION CARBIDE in one hundred-pound drums (always colored blue and gray) is as easy to store as coal – why it won't burn – why it can't explode – how we sell it direct at factory prices to most a million users and distribute it through two hundred warehouses scattered all over the United States.

Write us today for this wonder story, and ask us the hard question you have in your mind – just address

Wireless men wanted---

Greatest demand in thirty years for all classes of operators.

Prof. S. F. Mora, head of Marconi School of Wireless Telegraphy conducted by the Polytechnic College at 13th and Madison Sts., Oakland, has been requested to train 40 young men for service at the earliest possible moment. Railroad and Commercial Telegraph Companies are short of men and need hundreds of new recruits. Many land positions require a knowledge of both Morse and Wireless—and the College has decided to give a full course of both Morse and Wireless together for $75.00. (Six months required for complete course.)

Positions Positively Guaranteed

To those who enroll during the next 30 days or until the number shall reach forty students we are going to absolutely guarantee positions immediately upon graduation or refund the cost of tuition. Write for full information. Address

small head of cabbage, about one and a half cups tomatoes, a good sized potato and any other vegetable one cares to add, seasoning to suit taste, making vegetable stew.

If any meat is left over I make a hash, cut it fine and with a cupful of cold boiled potato sliced or diced boil a few minutes, adding a little of the stock if you have it. Season with salt and pepper and add two cups stale bread or enough to soften well, not making it too dry.

Do not boil after adding bread but just simmer on back of stove or the bread will be slick and watery.—Alice R. Bumgardner, Orange.

A Substantial Meat Recipe

Purchase amount according to the size of family of a cheap cut, about two pounds make a good amount when cooked according to the following. Cover with boiling water and let simmer gently until tender (covered closely). Season the broth to taste with salt and pepper. Let the meat stand in the broth several hours or over night. After standing in the broth remove the meat and add to the broth half cup minced onion, two medium sized carrots sliced thin, one and one-half cups of tomatoes and bit of bay leaf. Then press through a colander, add more salt and pepper if required. Run the meat through a food chopper and add to the broth. In the meantime have cooked a cupful of corn meal (yellow), line the bottom and sides of a baking dish with the mush, pour in the meat mixture, cover the top with mush and steam or bake one hour. Onions may be omited and a clove of garlic added, and if liked, potatoes or macaroni added to the meat mixture. — Mrs. A. Joseph, Quincy.

Meat Pie

I am sending what for us (a family of seven) is the cheapest meat according to the food value. I buy 35 cents worth of stew meat, three large or six small potatoes, three carrots, one onion.

Stew the meat until tender, add carrots and onion, then the potatoes. When they are all tender thicken the broth with corn starch to the thickness of beef gravy. Put the whole in a large pan and cover with a single crust made as follows: Two cups flour, two tablespoons lard, one teaspoon baking powder, a little salt, water or milk to make like pie dough.

This makes us, two adults and five growing children, two good substantial meals and is all that is necessary with some small dessert.

Hoping this will help someone who does not like plain stew, if it does not win a prize.—Mrs. Carrie Morse, Modesto.

Meat Loaf

I am sending in a meat loaf recipe which we use very frequently and consider superior to anything else we have tried, both in point of economy and palatableness. I buy one and one-fourth pounds beef (if possible a piece of neck meat which comes boned, and is one of the cheaper cuts), and three-fourths pound fresh pork. I run these through the meat chopper after which I run from 12 to 15 crackers through the chopper, add two eggs, a cup of milk, season with salt and pepper, mixing all together thoroughly. Steam or bake from two and a half to three hours. If baked I place it in the oven on an asbestos mat and cover the meat with hot water, basting with hot water frequently to prevent burning. This recipe will serve eight persons generously. This is delicious served either hot or cold, and sliced thin makes a splendid sandwich filling.—Mrs. A. A. Werner, Etiwanda.

Round Steak

Round steak is my family's standby and it goes farthest and has more food value than any other meat. Get a 25-cent round steak cut thick. Take meat axe and pound first one side then the other. Sift flour on both sides. Have frying pan hot with a little fat, to keep from burning. Put in steak, cook, then turn over and salt. Set a little back and cook till done, not less than half an hour. Take up and put on red hot platter. Add hot water to frying pan for gravy, thicken with flour and then turn over steak. This will serve four to six people well.—Mrs. Jas. H. Leggett, Oroville.

Dried Beef

You ask for economical preparations of meat for family use. Sliced dried beef, torn into shreds and browned in crisco. Add two tablespoons of flour and when thoroughly mixed add one pint of milk. The sliced dried beef can be bought in six-pound cans. It will keep several months in the kitchen cooler.—Mrs. Angeline G. Courtney, Heber.

Bean-pot Roast

Place three pounds of chuck steak in bean pot, cover with boiling water, cover and cook in moderate oven two hours. Add one cup carrots, one cup potatoes, cut fine, one-fourth cup sliced onion and two teaspoons salt. Cook until done, remove to platter and pour a gravy over the meat made from one cup of the liquid thickened with two tablespoons flour.—Mrs. C. R. Valentine, Triumfo.

APRIL PRIZE CONTEST

The suggestions for economical serving of meats in last week's and this issue have been exceptionally helpful, even compared with the always excellent contributions of Cultivator housekeepers.

Meanwhile food prices continue to mount with terrifying regularity. Where next shall we turn in our housekeeping business to hold expenses down to a living basis? To our home gardens, perhaps.

What vegetables did you can last year or what are you planning to can this year? What was your method and what were the results? Does it pay?

Cash Prizes

For best answer $2.00 in cash will be given; for second best, $1.00. All others published will entitle sender to three months' extension of subscription to the Cultivator unless such extension has already been granted in 1917.

All letters should be in this office by or before Thursday morning, April 19. They will appear in the issue of April 28. Send them in as early as you can.

With your letter send name of one to whom you wish extension of subscription credited.

And don't forget to save the articles on economical meats.

"The Real Safeguard of the Nation is the HOME"

Barker Bros. Great

"Confidence" Sale

of Home Furnishings

is a preparedness measure, as well as a demonstration of our CONFIDENCE in the Nation—its safety, prosperity and progress—and that real safeguard, THE AMERICAN HOME.

This great sale is a preparedness measure because it gives Southern California residents an opportunity to equip their homes—to make them citadels of strength and courage, places of refuge, centers of culture, refinement and peace, happy places to live in and go out from, prepared for national defense, active, everyday work.

While things are as they are and commodities are becoming scarcer and higher, Barker Bros. CONFIDENCE in our quantity buying enables us to offer QUALITY HOME FURNISHINGS at this time at an unprecedented reduction.

Saving Up to One-Fifth, One-Quarter, One-Third and Even One-Half.

Remember you can do your buying by MAIL through our Mail Order Dept. as advantageously as though you visited our store, yourself. Write us for what you need, if unable to call in person.

We pay the freight 100 miles and part of the freight for greater distances.

Barker Bros ESTABLISHED 1880

Citrus Fruit Market

LOS ANGELES, April 4, 1917.

This has been one of the greatest selling weeks and one of the smallest shipping weeks. The strike hag prevented heavy shipments but fruits shipped earlier have been in keen demand. In New York auction almost every day's sales show between 40 and 50 cars of California citrus fruits. The price has remained satisfactory, though possibly not quite so strong as the preceding week.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 15,783 cars, lemons 2762, total 18,546; to same date last year, oranges 13,038, lemons 2317, total 15,355. From Central California to date this year, oranges 4053, lemons 146, total 4217. To same date last year, oranges 4210, lemons 146, total 4356. From Northern California to date this season, oranges 483, last season same date, oranges, 610, lemons 1.

FROM THE AUCTION

March 28

FIGHT 405

Many are opposing the passage of Bill No. 405 before the state legislature. It provides that:

"All trappers within the state of California must take out a yearly license, citizens paying therefor one dollar and aliens, two dollars. A person applying for a license must furnish the fish and game commission with a detailed description of himself, his residence and where he intends to trap. Every year each trapper must report, under oath, to the game commission every skin he has taken, together with the name and address of the person to whom it was sold."

We are inclined to side with the protestants. It is claimed and it appears that if passed as presented it will mean the destruction of some of our finest fur bearing animals.

SAFETY FIRST.

It is said that the greater proportion of the losses from fire is due to carelessness. The Cultivator has always appealed to California campers to use caution when in the forests which mean so much to our state's welfare, but in addition, about farm buildings and the home, be sure that electric wiring and even the hook on which the old lantern is hung is in proper condition. Better be careful than sorry.

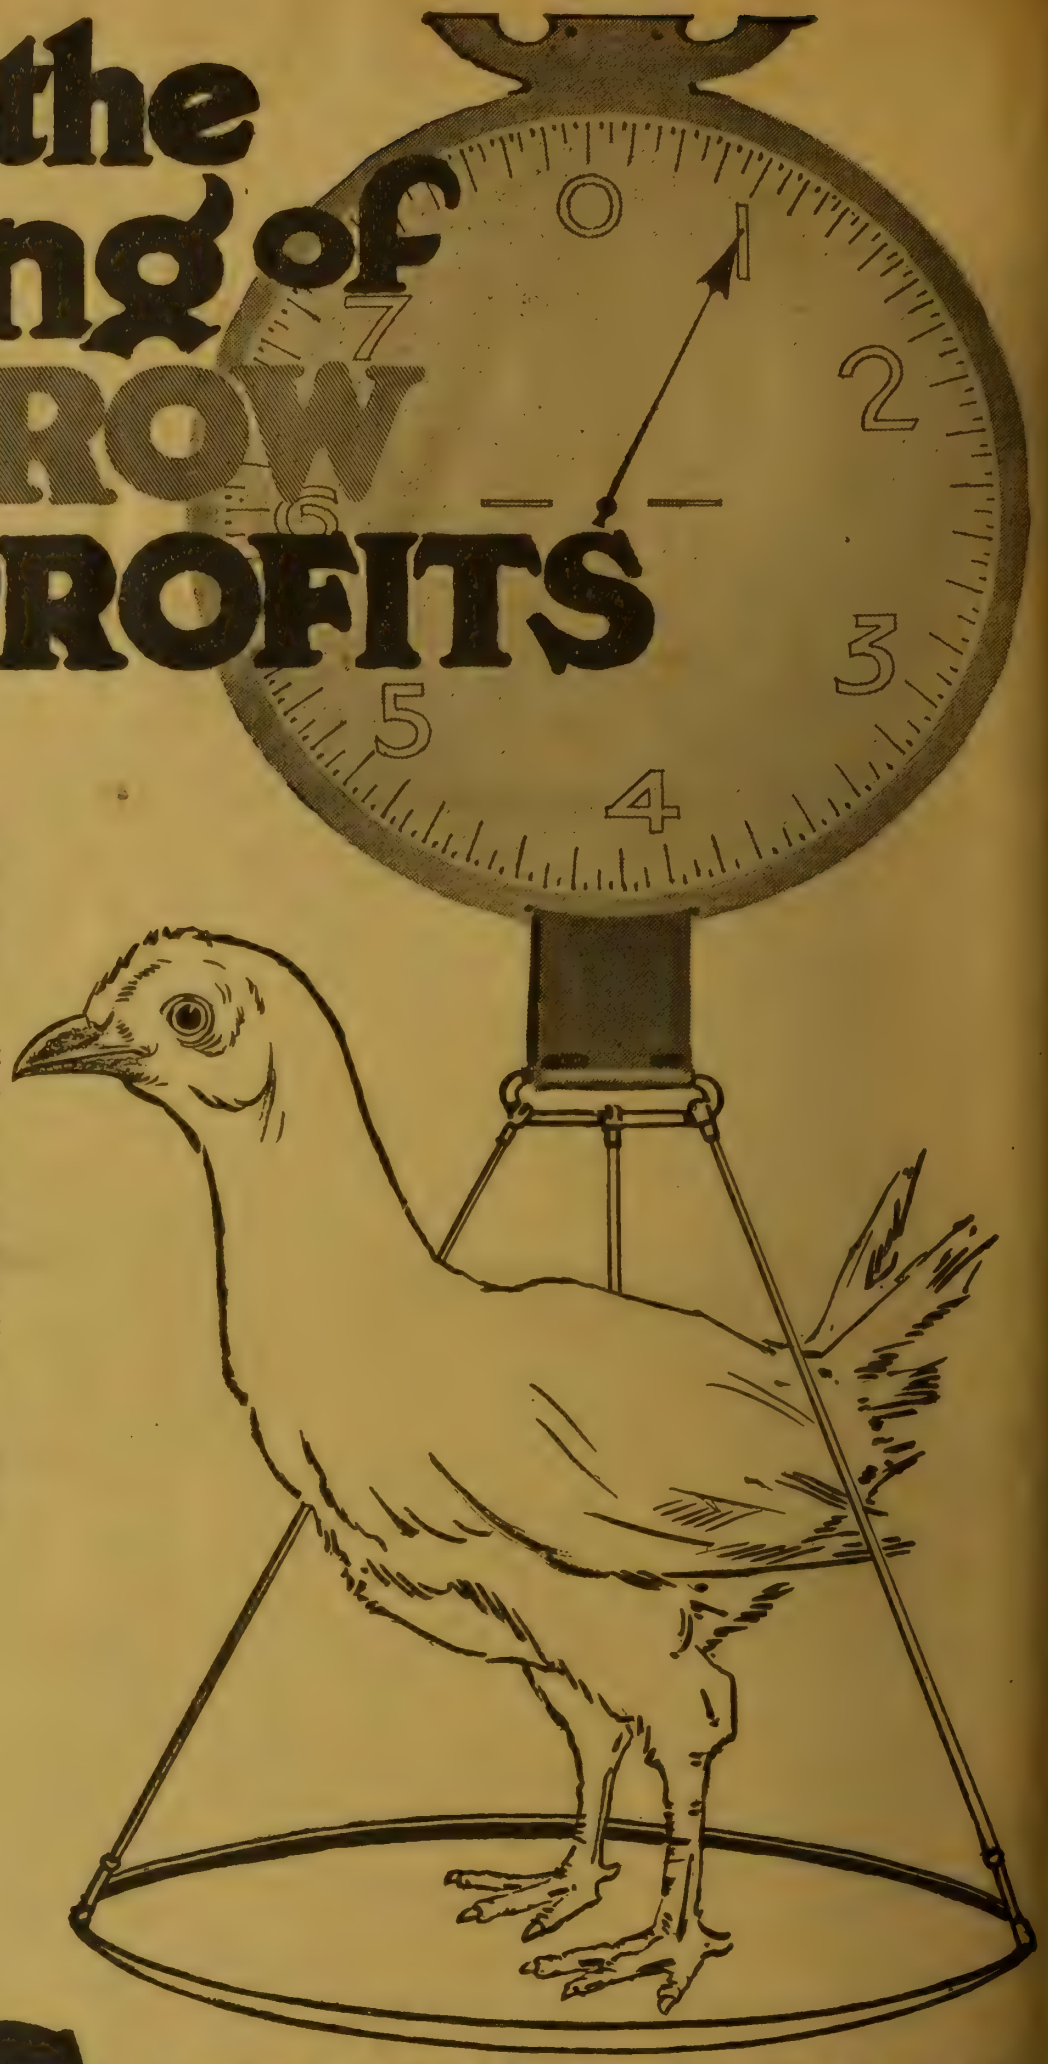
Where the Feeding of SUREGROW Shows PROFITS



Your scale will prove that

SPERRY SUREGROW

may be fed with positive assurance that it contains those essential food units which growing chickens must have to build bone and muscle in the right proportions for profitable market for breeding stock.

When you buy **SPERRY'S SUREGROW** you invest your money where it will bring large and immediate returns in the health and vigor of your flock.

Hundreds of testimonials from successful poultry raisers tell of the wonderful results and increased profits secured by following the valuable advice of poultry experts to be found in our booklet "Makes Hens Happy." If you haven't read it and are trusting to luck, clip the coupon and send for it today. Don't put it off.

When you feed Sperry Suregrow, digestive troubles, moping, slow growth, all disappear.

CALIFORNIA CULTIVATOR

THE LIVESTOCK and DAIRY JOURNAL Combined with CALIFORNIA CULTIVATOR

LOS ANGELES April 14, 1917 SAN FRANCISCO

$1150 F. o. b. Racine
Mitchell Junior—a 40-h. p. Six
120-inch Wheelbase

Mitchell SIXES

$1460 F. o. b. Racine
7-Passenger—48 Horsepower
127-inch Wheelbase

One Type—In Two Sizes

Built Like No Other Car

This model plant—covering 45 acres—was built and equipped for this single type.

It is designed to build this one type at a cost which none can match. John W. Bate, the great efficiency expert, has spent millions of dollars to do that.

The savings go into extras. So the Mitchell has a wealth of features which other cars omit.

All Mitchell cars are designed by our artists, and built by our own craftsmen. So each style is exclusive.

A Distinctive Car

Mr. Bate has worked 14 years to perfect this factory and this car. Every building, machine and method shows the last word in efficiency.

His methods save us on this year's output about $4,000,000. And all that goes into Mitchell extra values.

Our latest models are the result of more than 700 improvements made by Mr. Bate. He spent a year in Europe to get some of the ideas.

So the Mitchell offers, in many ways, what you cannot find elsewhere.

Unique Features

The latest Mitchells embody these distinct attractions:

31 Extra Features—
24 Per Cent Added Luxury—
100 Per Cent Over-Strength.

There are 31 features, most of which all other cars omit. Each is something you will want. Go see them. These are paid for by our factory savings.

On this year's models we add 24 per cent to the cost of finish, upholstery and trimming. Our new body plant saves the money to do that. This makes the Mitchell the luxury car of its class.

In the past three years we have doubled our margins of safety. Now each important part shows 100 per cent over-strength.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase and a highly-developed 48-horsepower motor.

Price $1460, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines with 120-inch wheelbase and a 40-horsepower motor—¼-inch smaller bore.

Price $1150, f. o. b. Racine

Also six styles of enclosed and convertible bodies. Also new Club Roadster.

To Double Car Life

The object of this new standard is to double car life. Over 440 parts are built of toughened steel. Safety parts are all oversize. Parts which get a major strain are built of Chrome-Vanadium.

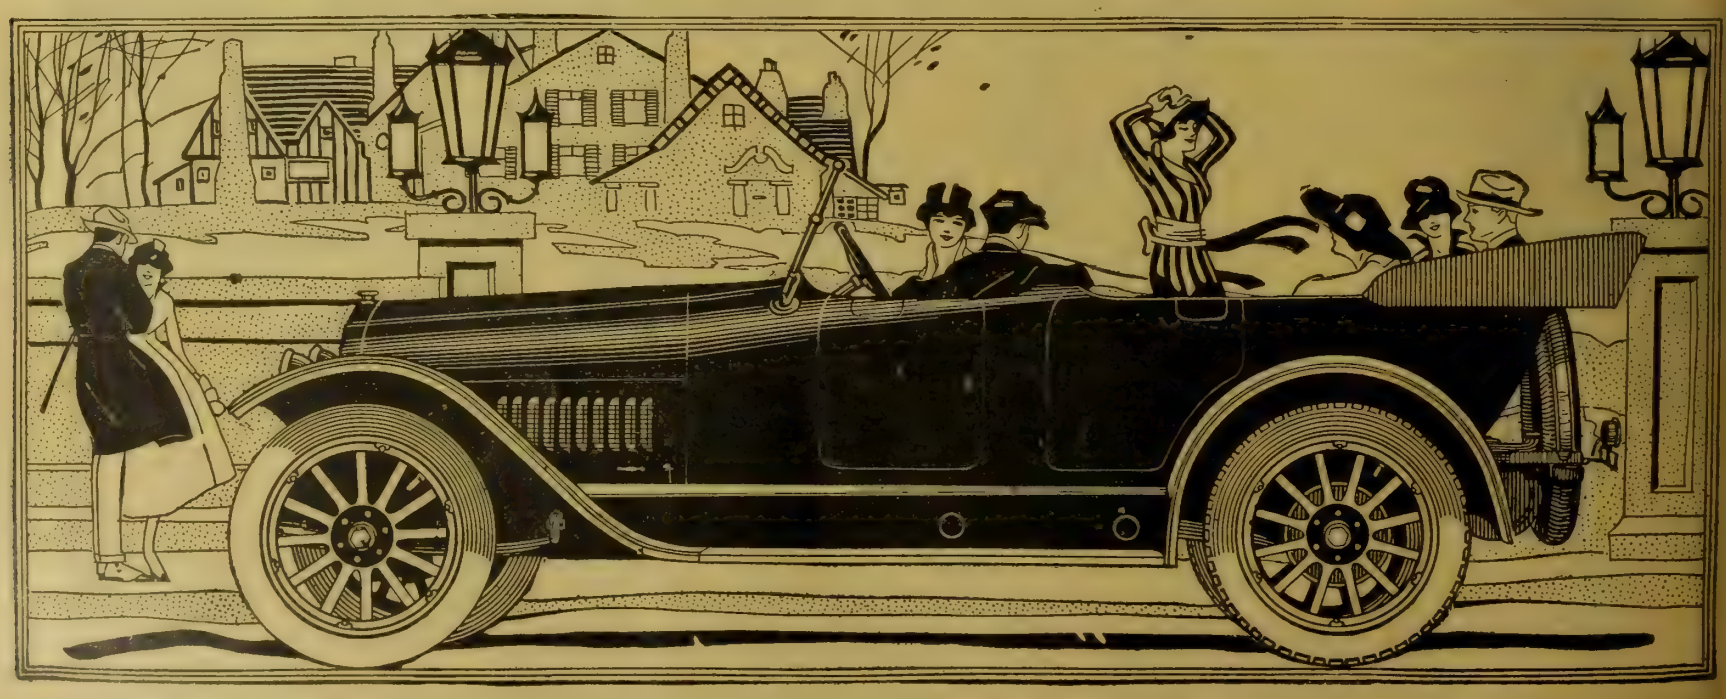
Our engine test is 10,000 miles without wear. Our gear test is 50,000 pounds per tooth. Our spring test calls for limitless service. Not one Bate cantilever spring has broken in the two years we have used them.

One Size, $1150

Mitchell Junior is about like the Mitchell, but a slightly smaller car. Still it has a 120-inch wheelbase. It is the marvel of Motordom this year in the value that it gives. See which size you like best.

You will want these extras. And, when you know, you will want a Bate-built car. It means a complete car, a smart car and a lifetime car. It is the last word in efficiency. Let your dealer show it to you before the spring over-demand.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.



California Cultivator

Vol. XLVIII No. 15 LOS ANGELES: April 14, 1917 One Dollar Yearly

A Demonstration by Corn Growers

One California Institution Purchases Nearly 1000 Tons of Corn Monthly. Of This Amount California Produces an Exceedingly Small Percentage. Talks at Stockton by Practical Growers Show California Possibilities in Growing Indian Corn

AFTER a three-year campaign to educate farmers as to California's need for more corn the Sperry Flour Company recently held a corn demonstration at Stockton. Over 200 people interested in raising corn were present and six implement concerns made display of implements for planting, cultivating and harvesting corn.

Manager E. J. Luke said:

E. J. Luke

Up until three years ago the Sperry Flour Company was using 500 tons a month. Ninety-five per cent of these 500 tons was brought in from the Middle Western states at an additional cost of $11 a ton for freight. This year we used about 700 tons right here in Stockton. We want to buy all that corn right here at home if we can, and what makes us think we can, is because we know that corn can be raised in California. The fact of the matter is, if the Eastern farmer can raise corn, pay $11 a ton freight and make money, the California farmer with only about a dollar a ton freight to pay can raise corn and make it pay.

A question that has come up is whether it is possible to raise too much corn in California. I might just say that the Sperry Flour Company in its entire system, using 1000 tons a month, is only a small unit in the state of California in the use of corn. Just to give you a few figures on what other states are doing:

New Jersey with an acreage of 5,260,000 acres, last year raised 22,550,000 bushels of corn; California with an acreage of 100,000,000 raised 2,160,000 bushels.

The more corn that is raised, the more it is going to be used here is my opinion, and while a great deal of Eastern corn is shipped in bulk, it is nothing compared to the mannfactured article brought in, and if you will give us the corn it will enable us to meet the competition of the Eastern manufacturer, and the state of California as a whole is going to be benefited. Again, you not only have the state of Cailfornia for your market, but Washington and Oregon to ship corn into, because they buy all their corn from the East.

Another thing—and we might say that we are just a little selfish in this matter—we paid out $140,000 for corn, from December 1, 1916, to April 1, 1917, and this $140,000 stayed right around Stockton. Now we figure that the nearer home we keep a dollar, the quicker we get it back again.

Still another thing. We are buying the corn on a 15 per cent moisture basis. You want to remember that we credit you with anything less than 15 per cent, and debit you with everything over 15 per cent, for 15 per cent is about as high a moisture content as corn can stand for it to keep. Another thing I want to speak about and that is having your corn thoroughly clean, for corn will not keep if it is not thoroughly clean. Seeing the machinery working here today, and after watching the sheller working, I think that it should be finished up with another suction.

Albert Westgate

A practical corn grower was then intoroduced. He said:

My experience has been confined to this last year. I have 140 acres out here at Terminus and from the 140 acres of corn grown I shipped to the Sperry Flour Company 4395 sacks of corn, for which they paid me $11,922 and some cents. I made many mistakes, a man has to find such things out. When I started to plant, the planters were set seven pounds to the acre. My man planted two sacks of corn in three days, and at first you would naturally think he was lying down on the job, but when you checked up on the acreage, he was doing good work. I naturally concluded that he was not putting in seed enough, so increased the seed from seven pounds to the acre to about 12, and this corn was my poorest corn. Two or three stalks to the hill are better than three or four stalks to the hill. Then as soon as your corn is up, keep cultivating. I kept a two-row cultivator in the field until the corn ran me out of the field. I think this is why I got such good results. As for irrigating, I think that a man can overdo the irrigating proposition in corn, just as the Chinaman does in overirrigating potatoes.

What we are up against here is the prohibitory cost of gathering. A man can't get off at less than nine dollars an acre. The machinery plan is the best to use in California. We California farmers are used to machinery, and it is pretty hard for any kind of practical machinery to stump the California farmer. We will find some way that will help us out on this gathering proposition. Another thing, we gather our corn and leave the stalks in the field. We get $1.50 to $2.00 an acre for them from the sheep men. They keep their sheep in our corn patch and fill up our ditches, leaving the bare stalks standing, and you can't clear them off for less than $1.50 an acre. According to government reports corn stover has a good feeding value. Corn stalks should be shredded and would sell for good money. What should they bring now with hay selling at $25 per ton? Not only that but we would save on cleaning the stalks from the field, which as stated before would cost $1.50 an acre.

Another thing which we are up against is the proper seed. We have

Keep Down Farm and Garden Pests

A Year of Great Demand for All Crops Calls for a Year of More Intensive Culture. Control the Pests, Which Mean Failure if Tolerated. Improved Methods with Best Insecticides Make Control Comparatively Easy

ONE of the easiest and perhaps most fascinating of things to start is a garden. After it is started, however, a bit of inattention, some drouth, bugs or fungus, may make the stopping of a garden fully as easy, if not so fascinating, as the starting. Of all California's years this is the most prosperous as to starting of gardens. Many will be carried to completion, will be cultivated and irrgated, and luscious greens and vegetables at the minimum of cost will be supplied to the table. A few will be discouraged, and to help these we offer a few suggestions.

We will assume that the physical side of garden culture, that is, the preparation of the ground, its irrigation, cultivation, etc., at proper times are all attended to, and will touch upon some of the fungous troubles and those other pests which cost farmers of the United States hundreds of millions of dollars and even discourage and bring disaster to some. The insects were here first and may be here last, so that understanding of their side of the question as well as ours is necessary.

The farmer and the gardener must get away from the position held by many, especially this year' amateurs, that a bug is a bug and that a cure-all may be applied which will reach everything that molests the garden. To these let us say:

The Wheel Hoe Saves Labor in the Garden

A Planet, Jr., or other wheel hoe, will cover far more ground than the ordinary hoe or rake.

There Are Fungous Troubles

We need not stop to define fungus, but the molds, the mildews, shot hole and other rusts, and even toadstools, are in this class. The best control method for most of the rusts and fungous troubles is the application of Bordeaux. Again pure sulphur alone may be sufficient, but first learn to differentiate between rusts and insects and bacteria.

Bacteria

For bacterial trouble there is practically no treatment other than removing, portions at least, of the plant affected. Perhaps the best example of bacterial trouble, which it is impossible to control if it has once taken possession of the plant, is tomato wilt. The same trouble affects potatoes, and once it has shown itself the plant should be taken up and burned.

There is another tomato wilt, however, which is a fungus which may come with fall rains and which may be controlled by spraying with a very weak Bordeaux mixture.

Insects

When one comes to the insects it must be borne in mind that here again is opportunity for study and need for knowledge of the different kinds of insects. First, there are the chewers, or eaters, and in this class are included various "worms", tomato worms, cabbage worms codling moth

THIS IS THE

Miller Bee Hive

A California Redwood Bungalow Home with Clean and Dainty White Pine Furnishings

Every Bee-keeper insists that his Hives shall fit. That is just the Bee in our Bonnet, the Hive that FITS. The Miller Hive now being produced in our factory will meet the requirements of the most particular bee-keeper in the state.

Every Miller Hive part must fit. Must fit like a soft, shapely new glove, before it passes the inspector. And the furniture, cut from fragrant Shasta pine, is sure to please that particular little housemaid, the Bee.

Miller Hives are made of California Redwood, without a knot or blemish in any part. There is no variation. They are uniform.

During the month of April we are offering a special discount on all hives and parts manufactured by us.

Poultry for Profit

Read what Portland Oregonian has to say about this book and its author.

There is a woman down in California who knows more about poultry than all the men in the state, and this, too, for that matter. Her name is Jean A. Koethen, and she has written a book which is published by the California Cultivator of Los Angeles, and called "Poultry for Profit." It costs a dollar, postpaid, and it ought to be in the hands of every one who is keeping hens. This paper has reprinted a lot of matter written by Mrs. Koethen and, because of its quality, her book is recommended. Climatic conditions in these states are so nearly alike that what is good or bad for fowls there is the same here. The price of three dozen eggs will get the volume and its purchase is a good investment.—Portland Oregonian.

Send in $1.00 for book or $1.75 for book and California Cultivator.

Cultivator Publishing Co., 115 N. Bdwy., Los Angeles

of the apple, etc. Also "bugs" come in this class. These insects are all reached through the stomach by poisons of some kind, usually an arsenate, which is the cheapest and most practical to use. Arsenates are now put up in such forms as to make success comparatively easy. Besides these chewers, or mandibulates as the entomologists express it, there are the suckers or insects provided with a sucking tube which is inserted into the juices of the plant and the sap drawn out as sustenance for the insect. In this class are some of our most perplexing pests, such as the scales of nearly all trees, aphis, plant lice, mealy bugs, etc. Poisons in no way affect these; they must be reached by contact insecticides. Among these are the rosin washes, petroleum emulsions and mixtures, tobacco sprays and dust, and other caustics.

The Cultivator has formerly issued pest fighting numbers in which some 30 to 40 formulas for various sprays have been given with full directions for mixing. These formulas will not be repeated in this issue, for we are now speaking more to the gardener or grower of small crops. As a rule he is not fitted for the compounding of his own sprays, and nowadays every seedsman and most nurserymen carry sprays suited to almost every pest. These ready-to-use sprays are practically as economical as the home made and are almost certain to be more effective. Specific directions are given on the original package and following them the gardener will secure results.

The Machine

For applying these sprays and dusts inventive genius has given us appliances from a dollar to as high a price as the sprayer can afford. For large commercial orchards great power outfits capable of running four or even six nozzles at a time, and carrying the spray to the tops of the highest trees are to be had. For potatoes and field crops sprayers which will take four or more rows, completely covering the leaves of potatoes, both under and upper sides, also for spraying celery or any other field crops have been provided. For the gardener there are innumerable knapsack or other small appliances which may be secured at from $5.00 to $15.00, which are most effective. There are also dust machines from the little hand bellows which has been used for years to distribute buhach on flies and house plants to larger ones, also of the knapsack type. Some of these machines are power driven on a larger scale for controlling spider and other orchard pests. Properly handled these "dry" sprayers are most effective. Our advertising columns give more information regarding these appliances.

But as the Cultivator has said before; "An ounce of prevention is worth a barrel of spray. Here is where our state and county quarantines have prevented spread of many pests, but it is up to the grower to be as watchful as the inspectors should be. For example, if potatoes are to be planted, are they covered with scab or are they infested with bacterial troubles? Learn about these pests, but after being sure that there are none on the seed purchased then treat with preventives, for no potato crop is successful which is at the same time harboring scab or other pests.

Grapes

Nearly every garden has a few grapes; nearly every grape has mildew. Mildews are easily controlled by liberal use of flowers of sulphur. Apply with some dry duster, or if only a few vines about the house, the sulphur or other material may be placed in coarse mesh bags and shaken over the leaves in the morning when the dew is on. The sulphur does not act directly, but the heat of the sun vaporizes it, destroying the spores of the fungus.

There are also phylloxera, vine hoppers, erinose and other pests of the grape, but each of these calls for such expert treatment that only bulletins issued by our state experiment station would give sufficient instructions or information along this line.

Raspberries, Strawberries and Other Small Fruits

Rose scale is one of the worst pests of the small fruits. It may be controlled in part by strong pressure of water from the nozzle or a good spraying when dormant with commercial

PRODUCE BIGGER CROPS

USE AMBOY GYPSUM

California soils are severely deficient in sulphur and other valuable elements so vastly important in the production of BIG crops. AMBOY GYPSUM replaces these locked-up elements and does other wonders. Increases soil fertility wonderfully. **OUR FREE BOOK** on gypsum facts should be in every rancher's hands. Write at once for it. Tells how, when, where and what gypsum to apply to alfalfa, citrus, garden and other lands. Best booklet of its kind.

GYPSUM FACTS

Consolidated Pacific Cement - Plaster Company
611-612 SAN FERNANDO BLDG.
LOS ANGELES, CAL.

ne-sulphur; also effective with this st is the rosin wash which may now had ready prepared.

San Jose scale. Same treatment.

Strawberry plant lice. Spray with erosene emulsion or rosin wash.

Orange Rust, so-called because of its ep orange color. Affects most of the aspberry and blackberry family. here is practically no remedy for alks infested. Cut them out, burn ithout scattering the spores any ore than necessary. Spray again with ordeaux. Spray again with Bordeaux nd perhaps the best canes may be aved from infestation.

eans and Peas

Wireworms are serious pests. Fertilize heavily with kainit, sulphate of mmonia or a nitrate. Do not apply o close to plant.

Aphis. One of the worst pests. pray with tobacco or rosin mixtures.

Cut Worms and Army Worms. hese are pests of the worst kind in ome years. Poison with bran mash ixed with Paris green consisting of ran ten parts, Paris green one part, olasses or glucose two parts.

Weevil may be controlled by fumiating seed with bisulphide of carbon. Use a bin. For each 1000 cubic feet f space in the box or bin in which the umigation is to be done use one pint isulphide. Place in shallow dishes n top of seed. Leave tightly closed or 24 hours. Be careful of fire as the as is explosive.

There are anthracnose, blight, rust, ildew and other pests of peas and eans. These if taken in time may e controlled by spraying with 3-5-50 Bordeaux.

Cabbage Worms, Aphis, Cabbage Bugs. Apply hellebore or spray with obacco extract or rosin wash.

Tomatoes

Worms. Spray with arsenate or Paris green.

Diabrotica, which are chewers, eat eaves and blossoms. They may be controlled by poison sprays. They are sometimes called lady birds, which hey are not in any sense. They are a greenish bug with black spots.

Fusarium or summer wilt of tomatoes is impossible to control except ng by planting disease-free plants on soil not infected.

Fall Blight. Spray with Bordeaux.

Potatoes

Plant scab free potato seed. If there is any question dip in formalin one ounce, water two gallons, or corrosive sublimate two ounces, water 15 gallons. Leave an hour and a half in one of these solutions.

Corn Ear Worm. Easily controlled with the dry form of arsenate of lead. Apply as soon as ears are formed by dusting powder over the silk end of the ear. One of the effective remedies on the market for this purpose is Corona Dry.

* * *

Moles do but little harm but if necessary to use means of control the trap is the most effective.

Gophers are more destructive. The trap is the surest though good control measures are effected by the use of poisoned raisins, pieces of potato or fruit. Use strychnine, a very small grain placed in the middle of a large raisin or in the tissue of a potato and placed in the burrow.

Squash Bugs. Disagreeable and disgusting is the squash bug, a dark grayish brown, mottled yellow underneath and about three-fourths of an inch long. This is the common stinkbug. He gets fat on poisons. Begin very early in the spring with handpicking.

Slugs: Air slaked or hydrated lime or even fine dust is usually death to these disgusting pests. A ring of lime or tobacco dust about a small plant or scattering lightly over plant will usually prevent attack. Safest way is to be out early in the morning and gather the pests in a bucket. Poisons are not generally satisfactory with this pest. Another repellent is coal oil, which may be poured over ashes, gypsum or similar absorbent and scattered liberally about the roots.

NOTES

It is not only "how" but "when" you do the things which make a garden. For instance, in the control of the pests noted above if taken in hand when they first appear it is a case of "a spray in time saving nine million" or more. This is especially true of aphis. In other words, watch the garden day by day. A simple and com-

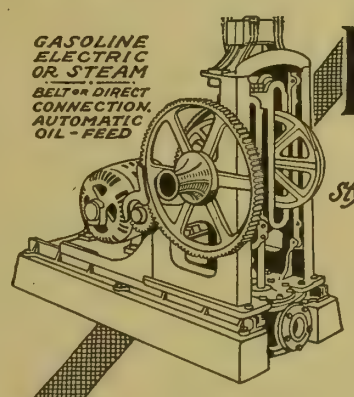
APRIL is an ideal month in which to plant orange and lemon, pomelo and lime trees. The advent of warm weather as the rainy season draws to a close, renders the soil ideal for tree growth. Ideal conditions call for ideal trees, which are the only kind we have to offer, hence are anxious to serve you. Correspondence a pleasure; a telephone message a joy; and a personal interview a delight.



LUITWIELER PUMP

Styles and Sizes for Different Requirements

Non-Pulsating

As much as five times more power-energy is required to start an inert or stationary body than to keep it in motion. This mechanical truth applies to raising a column of water as well as putting a train in motion.

With this in mind, the famous Luitweiler Pump was perfected.

By the use of heart-shaped cams the action of the plungers is regulated to operate in such a manner as to lift the water in one steady, continuous stream with the very least expenditure of power. The perfect balance constantly maintained makes possible the very highest efficiency.

Ideally adapted for ranch service. Many sizes for every requirement.

Ask for our free Pump Booklets, which give detailed information.

94 Years in the ground and unharmed by Rust ! —

IN 1823 the City of Cincinnati laid water mains made of oak logs with the centers bored out. To prevent the logs from checking, hand-made iron bands were placed tightly around their ends like the hoops on a barrel. Now after more than ninety years, these are being dug out. The bands are still in good condition because they were made out of iron that was practically *pure.*

"ARMCO" IRON CORRUGATED CULVERTS

are made of iron that is even purer than those old bands. "Armco" Iron is *never less than* 98.84 per cent pure iron while analysis shows that in both cases scarcely more than a trace of either Manganese or Copper can be found; and all their impurities taken together make barely one-sixth of one per cent.

This is why "Armco" Iron Culverts resist rust and give long and economical service. They represent enduring value for the taxpayer's money. Insist on having the longest lived culverts in your highways. The "Armco" Trade-Mark on every section is your guarantee.

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing and Formed Products, write the manufacturer in your vicinity, or

Growing of the Raisin Grape

IN "Notes of Methods and Costs, California Crop Production", compiled by R. L. Adams of the College of Agriculture, we have an outline of planting and cultural practices for growing the raisin grape.

Climatic Requirements

Freedom from frequent late spring frosts, conditions for early ripening and freedom from heavy fall rains during ripening and harvest. Four or six weeks of dry weather usually required following picking to permit proper drying.

Soil Requirements

Deep, fertile loam, the heavier loams for Muscats and the lighter loams for Sultanas. Freedom from alkali and standing water during growing season.

Water Requirements

Grape secures color and quality when grown with sufficient rather than excess water supply. Sixteen inches is average minimum without irrigation.

Planting and Care of Vines to Maturity

Short pruned vines should be planted six by 12 feet, long pruned, six by 12, or some prefer six by 16. If rows run east and west leave roads for hauling north and south about every 200 feet. If planted six by 12 feet 600 vines per acre are required. The planting should be completed before the end of March. These vines should reach bearing, or at least self-sustaining age, by the autumn of the third year. In the absence of serious disease 20 years should be about the length of the profitable life of the vineyard.

Varieties: The most popular raisin varieties are Muscat, Sultanina, or Thompson, and the Sultana.

Irrigation: Usually one irrigation, ordinarily given in late spring (April).

Pruning: December-March. Pruned to either spurs or canes (if canes, these tied to stakes or horizontal wires.) Suckered in May and June.

Spraying: April-June. Sulphured for mildew one, two or three times, except the first one or two years.

Cultivation: Plowed and cross-plowed (January-March), hoed once (June). Harrowed into shape. Cultivated six times, beginning in April at monthly intervals.

Supports: Sultanina and other trellised varieties. Vines tied to temporary 1¼″-1¼″ stakes—later to permanent trellis. Muscat and other varieties tied to 2″ x 2″ stakes.

Care of Vineyards After Maturity

Irrigation: Usually one irrigation, ordinarily given in late spring (April).

Spraying: April-June. Sulphured for mildew one, two or three times.

Pruning: December-March. Muscats pruned to short spurs. Sultanina to fruit canes and renewal spurs.

Fertilizing: Occasionally a little fertilizing done, principally as applications of grape pomace, green manures and stable manures.

Cultivating: January-March. Plowed, cross-plowed and harrowed into good shape. Cultivated four times at monthly intervals, beginning in April. Hoe one time around vines in June.

Harvest

Time, August 20-October 1.

Method: Clusters cut by hand.

Preparing for market: Spread on trays holding 22 pounds (2 ft. x 3 ft.) placed in the rows, cured, sorted, and delivered to raisin packing house. In the Sacramento Valley the Sultanins are dipped and dried in a drying yard.

Yields

Good: One and a half tons raisins.
Usual: One ton.

Annual Cost from Setting Out to Self Sustaining Age

Cultivation ($5-$8) $7 per acre; stakes or trellis (first year), $20.00; tying $1.50; pruning two years' total $3.00, sulphuring, two years' total $1.50, hoeing, two years' total, $2.00 burning brush (second year), 50c.

Annual Upkeep After Maturity

Sulphuring two times, $1.25 per acre, cultivating ($5-$8), $7.00, pruning and burning brush, Muscats $4.50 Sultanina $10, suckering $1.00, tying Sultanina $2.50, hoeing—Muscats—$2.00; Sultanina, $4.00.

Cost of Harvest

Gathering ($7-$16) $10 per dry ton handling trays $1.50, turning and stacking $1.25, packing in lugs $1.25 hauling (4 miles) $1.00.

Four Years' Success

"The close of the fourth year of the Associated Raisin Company, says the Fresno Republican marks an epoch in what is up to the present very much the most successful cooperative producers' association yet undertaken in California. The old raisin association with all its ups and downs had within itself seeds of its own dissolution, and the end, when it came, had already long been inevitable and foreseen. It lived its life in turmoil and it paid the price of politics for its intermittent business success. All in all, it was a good thing while it lasted, and it is remembered with respect and appreciation, but its success was not, and under the circumstances, could not have been made unconditional."

The Associated Raisin Company in a new way and under different politics has accomplished quietly by business methods not only all which the old association accomplished, but also all of that toward which in its wildest turmoil it aspired. The association has maintained the confidence of the growers and of the business world to an unprecedented extent, and its success in hard years and in easy is a

HAS MADE MILLIONS FOR RAISIN MAKERS

James Madison, vice president and manager, California Associated Raisin Company. Mr. Madison has been a power for good to every raisin producer in California. For years he has fought for their interests, and with the contracts ending within the next year the question now is asked, "Will the growers renew contracts and sign up for another period or will they be drawn away by the fact that the present exceptional year gives opportunity to outside interests to discourage continuance of the cooperative movement?" Such a result seems impossible for the growers are too clear headed to forsake the organization which has made them.

onument to the sound basis on hich it was established. It faces ext year a new crisis. Its contracts ith the growers and its leases on ome of the principal packing estab-ishments will expire. Its continua-ion will require effort and doubtless ome agitation. It will require the etermination of polfcies which may ave two sides and may provoke con-icting judgments. But the very fact hat this critical future is faced with alm and quiet confidence on the part f management and of growers makes t so certain that almost no question f doubt has been raised that it will ucceed and will establish itself as he permanent and finally the inde-tructible organization of the raisin ndustry of central California."

Crop Reports

THE Cultivator's first estimate on apricots was 50 per cent of a crop. It now appears this stands a chance of being a reasonably close guess. However, many who were at first much discouraged at the outlook are more hopeful.

On next page is given liberally of he figures just issued by the state ommissioner of horticulture under ate of April 7. The Cultivator will e glad to hear from others who have not given estimates of their sections, also from those who may wish to change their former figures. We be-lieve these reports have aided many a fruit grower in judging as to market possibilities for this year.

Head of the Peach Growers' Association

J. F. Niswander, vice president and general manager of the California Peach Growers, Inc., who is endeavoring to se-cure for peach growers fair returns for their years of labor. Peaches are a staple and they should never go begging as they did a few years ago, and they never will if the present organization is en-couraged.

D. F. Norton, Grass Valley, Nevada County.

In a general way I will say that the outlook is very promising for a nor-mal crop. The very high price that our pears brought in the Eastern market last year has stimulated our orchardists to grow only standard fruit, and more spray material has been used this spring than ever be-fore in the history of the county, and we are going to try and establish a record for shipping nothing but strictly standard fruit.

Edw. O. Amundsen, Farm Adviser, Placer County

The frosts of Thursday and Friday mornings (March 29 and 30), wrought great damage to the fruit crop of Placer County. Practically all the early plums are gone, pears probably 60 per cent loss; cherries almost all gone in lower locations; peaches prob-ably 25 per cent loss. In some sec-tions practically all the fruit is lost. Apparently all the crops will be ex-tremely light.

Apricots, practically all gone; al-monds, big loss but too early to esti-mate; cherries, probably one-fourth crop; peaches, three-fourths crop; plums, early plums probably a 25 per cent crop, Santa Rosa, Wickson, Bur-bank, Kelsey.

A. H. Christiansen, Farm Adviser, Humboldt County

The outlook in this county is for a 100 per cent crop of all the fruits, in-cluding apricots, peaches, prunes and apples, which are the maximum crop of this county.

Fred C. Brosius, Deputy Horticultural Commissioner, Sacramento County

Regarding condition of crops in this county will state that we are a small producer of apricots but expect to have 80 per cent thereof, almonds 90 per cent; cherries, 100 per cent; pears, 100 per cent; peaches, 100 per cent; prunes and plums, 90 per cent.

While there was a small loss of early almonds and early plums, the in-crease caused by new orchards com-ing into bearing will offset a slight damage done by the continuous frosts. In my opinion the crop of cherries,

This is Styleplus Week from Maine to California!

The price remains the same!

Leading merchants the nation over are this week featuring Styleplus Clothes $17. Today more than ever before this price stands out to the nation. Our Style, our Quality, our Guarantee of Satisfaction have created a new standard of value at $17 from Maine to California!

Styleplus Clothes $17

TRADE MARK REGISTERED

"The same price the nation over."

(Price in Cuba $23)

By contracting for great quantities of cloth at the outbreak of the war, by doubling our output and so decreasing our costs, by our scientific plan of concentrating on this one-price suit we have effected great economies and kept our price the same. The same style in the fabrics—all-wool or wool and silk. The same honest, sincere workmanship throughout. The same smooth fit and splendid wear. The same guarantee! The same price!

Of course you realize how big an advantage it is to *see* and *try on* the clothes *before* you buy them. If you buy direct from the nearest Styleplus dealer, you know exactly what you are getting. Look for the Styleplus Label in the coat collar. If there should not be a Styleplus Store in your town, ask your favorite dealer to order a Styleplus suit for you.

peaches and pears will be exceedingly heavy this year.

H. P. Stabler, Horticultural Commissioner, Sutter County

Apricots, 75 per cent; almonds, 85 per cent; cherries, 100 per cent; peaches, 100 per cent; prunes, 100 per cent.

N. E. Mathews, Santa Ana, Orange County

Having grubbed out my apricot trees, and upon telephoning my friends found they had done likewise, I seemed to be unable to get on the track of any definite information of value, but the following clipping from the Santa Ana Register will probably give information you want if it is not too late.

Santa Ana Register, Orange County

With record crops promised and indication that prices will go to 15 cents per pound, apricot growers of Orange County promise to fare as well this year as will the bean growers. The county crop will bring growers between $250,000 and $300,000. Buyers are now offering to contract the coming crop at 11 cents per pound, and some growers have taken such contracts. Many of the producers, however, believe that before the harvesting season is over the fruit will advance to 15 cents per pound. Last year's dried fruit has been cleaned up. In a general way, the came condition obtains with reference to other dried fruits.

'Cots have set so thick that many will be crowded off the trees as the fruit develops. The tonnage in Orange County will be right around 1100 tons of dried 'cots, which is about the usual yield. However, hundreds of acres of trees have been grubbed up within the last year, and the less acreage producing the average tonnage tells the story of the crop set on the trees.

G. H. Hecke, State Horticultural Commissioner

Reports thus far available indicate that but slight damage has resulted from the frosts and rains during the past month. While a few sections report a 50 per cent loss, others claim no harm has been done and admit in a general way that the loss sustained amounts to little more than proper thinning would entail.

Reports received at the office of the state commission are, as a rule, generally optimistic. Almonds show but a slight falling off from the normal, and this may result in a crop above the normal when the harvest is reached, as is frequently the case.

In some places peaches show a slight decrease, but the general average is above the normal condition.

Stanislaus and Santa Barbara Counties show normal conditions; Madera admits slight damage to apricots; peaches and apricots are said to have been pinched a little in lower San Joaquin; Hemet Valley reports some damage to apricots; Kings County is so close that authorities do not agree; Fresno reports but slight damage to peaches, and all down the line the average would indicate that with continued favorable conditions the crop of fruits and nuts in the state for 1917 would be one of the largest in its history.

George P. Weldon, Deputy State Horticultural Commissioner

POTATOES

9 4-5 Bushels from One Pound of Seed

Three potatoes, planted in 56 hills in Huron Co., Ohio, yielded this amount. The seed, the planting, and the crop harvested are matters of county record. You can do as well or even better by following my instructions. It is not a matter of variety of seed, or soil, or fertilizer used, important as each of these matters is, but it is the selection and cutting of seed and treatment. It was these elements that enabled me to produce the yield of 552 lbs. of potatoes from one pound of seed. Full information as to how it was done, the seed used, the soil, the fertilizer employed, the tillage and the methods of producing this large crop will be sent for One Dollar. Send your order now and grow more potatoes from less seed. Any one who feels too poor to spend a dollar to learn how to increase the yield in raising potatoes send me your name and address. Planting time is near. Send your order today and raise more potatoes from less seed.

D. D. Sharp, Horticultural Commissioner, Riverside County

Reports from inspectors in the various districts changes my expectations on the frost damage to apricots. I expected the most frost damage to be in the Banning section, instead of which Hemet has been injured to a greater extent than either Banning or Elsinore. The latter district appears to have sustained no material damage. These districts having the largest acreage in apricots our estimate is based accordingly. The apricot crop was injured more than any other crop by the frost during March.

The following is my estimate for the deciduous crop outlook as it appears at the present time: Almonds 70 per cent, apples 100 per cent, apricots 50 per cent, cherries 50 per cent, table grapes 80 per cent, wine grapes 100 per cent, peaches 80 per cent, prunes 100 per cent. Olives and citrus at the present time appear to be normal, citrus being very late in blooming we cannot as yet form any estimate other than to report conditions at the present time as being normal.

THE SPARROW PEST

Written for California Cultivator
By E. A. White

I have noticed several articles in recent issues relating to sparrows destroying young vegetables. All seem to think it is the English sparrow; but such is not the case; it is the Crown sparrow, an American song bird. Males have white stripes across back; females have no stripes and much resemble the English sparrow. I have investigated many places where complaints have been made, and in every case it has been this Crown sparrow.

They come to Southern California in October and stay until the first week in April when they go north to nest from Oregon to Alaska. During their stay here they do hundreds of thousands of dollars damage, eating nearly every variety of garden truck, even destroying fields of potatoes. The only vegetables I have not known them to eat are onions and carrots; also they eat all kinds of grain and are a nuisance both to the gardener and poultryman as they will go through one inch mesh wire. Poisoning seems to do little good, as like the flies they come in droves. They never sing here, only on their breeding grounds. Some one should make a thorough investigation and see if there cannot be some law passed to get rid of them. They are a protected song bird.

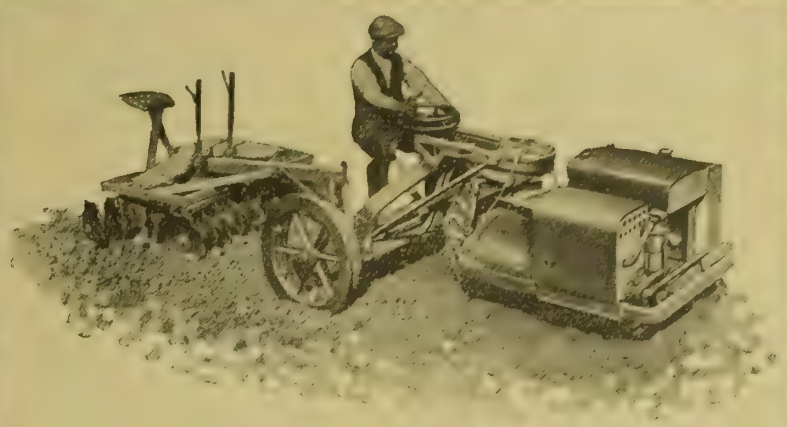
AN INSTANCE OF PROFIT

imperiled a $100,000 investment can imperiled a$100,000 investment can be credited to County Horticultural Commissioner Swett of Contra Costa County and his inspector, V. G. Stevens. A consignment of 14,000 pear trees was recently received. Investigation developed the fact that no real examination had been made. The Oregon authorities depended upon the statement that the trees were grown upon a Japan root and were therefore resistant to aphis.

California investigations made under direction of Commissioner Hecke show that aphis will colonize on the Japan root, and while they may not cause as much damage as they do in working on the French root, it is plain that their board and lodging must cost something to the tree.

The nursery shipping the trees has agreed to give this matter careful attention in the future.

Save Money Cultivating with a Bean TrackPULL SIX HORSE Tractor



For pulling a cultivating tool, the Bean TrackPULL SIX HORSE Tractor hasn't an equal. This little machine also excels at plowing, discing, harrowing, spreading and other farm, orchard or vineyard work.

THIS IS WHY

The Bean TrackPULL Six-Horse Tractor is superior because its weight is only 2875 lbs.; does not sink in or pack the softest soil. Efficiency: It is the Tracklaying type, traveling on its own track, giving long traction, and responds quickly when a turn is to be made. Power: It does the work all day long that six hard working horses can do working continually, and it never wants to loaf when the hot days come. Superior Construction: It is equipped with Le Roi 4-cylinder vertical type—4-cycle motor, Donaldson air clarifier, Bosch ignition, Famous Hyatt Roller Bearings and New Departure ball bearings throughout, Perfex radiator, water cooled with centrifugal pump and fan, combination splash and pump lubrication, and is so simple a boy can operate it.

Completely circling a lemon tree with a 6-ft. Double Disc.

Pulling 12-ft. Forkner Cultivator making difficult turn. Distance between tree and fence 12½ ft.

Write us for the name of nearest TrackPULL agent and other information.

Prompt Deliveries in April

Standards of Service

In rural communities clusters of mail delivery boxes at the crossroads evidence Uncle Sam's postal service. Here the neighbors trudge from their homes—perhaps a few yards, perhaps a quarter mile or so—for their mail.

Comprehensive as is the government postal system, still the service rendered by its mail carriers is necessarily restricted, as the country dweller knows.

Long before rural delivery was established the Bell System began to link up the farmhouse with the neighboring towns and villages. One-fourth of the 10,000,000 telephones in the Bell System are rural. They reach more places than there are post offices. Along the highways and private lanes the telephone poles lead straight up to the farmer's door.

He need not stir from the cheerful hearth ablaze in winter, nor grope along dark roads at night for friendly news or aid in time of trouble. Right in the heart of his home is his telephone. It is the American farmer's key to the outside world, and in no other country is it found.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Breeding Age of Heifer

Please advise age to breed heifer calf intended for family cow.—Subscriber, Anaheim.

This question was referred to Guy H. Miller, who answers: As this heifer is to be kept as a family cow there is no particular object in having her come in at a certain time of year as would be the case were she intended for a dairy cow. I would advise breeding her when she is about 15 months old, thus having her freshen at about 24 months of age, which I consider a very good age. I would then hold her over for four or five months before breeding her for her second calf, thus giving her a chance to make good growth between first and second calves.

If she is a heifer that is very small for her age I would not breed her the first time until she is 18 months old, but give her good feed and let her attain fair size before breeding, so that she will not be set back in her development during her first milking period.

Guinea Fowls

Where can I purchase guinea fowl or guinea eggs? Can eggs be hatched in incubator? If so how long does it take?

We find no guinea fowl breeder among advertisers in the Cultivator. Take notice, please, readers who have such stock and send in your advertisement. Guinea eggs require 30 days for incubation. I see no reason why they should not hatch in an incubator, but they are usually incubated by chicken hens. One good sized hen can cover 20 guinea eggs, and unless one has several pairs of guineas he is not likely to need to incubate more than this at one time.—J. A. K.

Wire Worms Eating Beans

Mr. A. E. de Fremery of La Honda writes:

I see in the Cultivator of March 31 in the query column, that a subscriber at Nestor has been troubled with worms eating the bean seed when planted. It is possible that the worms are weevils, but I am inclined to think that they are a species of wire worms. When I was in the Sacramento Valley last year one of our fields was so badly infested with wire worms that it had to be replanted. Not only were the beans eaten, but plants over six inches high were attacked, the roots being eaten on the inside up to, but never above, the surface of the ground. The worms seem to travel from seed to seed in the row and from plant to plant, two or more often being found on a seed or root. They vary in size from one-quarter to three-quarters of an inch in length, ranging also from cream to a yellowish brown in color .

Hired Man

Is it fair for a hired man working on a ranch to take an hour and a half for dinner when employes of corporations are allowed but an hour? Where a hired man lives with his employer's family and is treated as one of the family would it not be fair to expect him to split kindling or bring an occasional bucket of water, especially while taking his after-dinner smoke? Should not a bright young man rise in the morning and do his chores and put in the legal number of hours, the same as employes in stores, offices or factories?—Subscriber.

This is a case where both sides have rights and privileges. It should be the privilege of the hired man to lighten the work in the house where he is made practically a member of the family. Common courtesy would demand of him many helpful things. As to time in the field, without question the full day's time should be put in at the work in hand. The eight-hour-a-day man in the manufactory is supposed to have coat off and to be at the lathe ready for action the moment the workday begins. On the other hand, the man on the farm often has many chores which get him out even before daylight, and this compels more or less laxness in regard to regular hours. The valuable hired man, however, is not one who sticks for his rights in every little particular, but is willing to do his share. The valuable employer, likewise, is one who secures greatest service from his employe through good will and extending to him occasional courtesies, as well as giving absolute rights.

Estray Act

Does the estray act apply to poultry where one's property is fenced with an ordinary wire fence?—Subscriber, Lemoore.

The estray act would hardly apply to poultry. That is, under it estray stock may be empounded, and the cost of keep, which must be reasonable, is all that may be collected, but if one's place is surrounded by a substantial fence and poultry trespasses and does any injury, the owner of the stock may be sued for damages.

Strawberry Rhubarb

Would like to ask as to strawberry rhubarb, why is it so popular? I note that as soon as it appears in the market Crimson Winter finds lessened sale. Why does it come from the north? Can it not be raised in the southern end of the state?—Subscriber, Burnett.

The strawberry is one of the finest of rhubarbs. It has been grown for years in the Bay section. It is also being raised in certain sections of California, but it is now almost impossible to secure roots for new settings because of the keen demand. The stalks of the strawberry variety are longer than those of the Crimson Winter. The Crimson Winter is a magnificent plant. It has one fault, however, that while it is nearly all reproduced by seed it has the characteristics of seedlings in that some of it is of highest quality while some is exceedingly small with lead-pencil like stalks.

Queen Excluder

Should I put a queen excluder under the first super? If so how is it made? Could I put a super in the opening to keep the queen in and prevent swarming? If so, how large a space should I leave for the workers?—Subscriber, Gaviota.

This question was referred to M. H. Mendleson and he answers: "Queen excluders should be used when a colony is strong enough or overflowing with bees, or in a crowded condition both in brood and bees in the brood chamber, and plenty of new honey coming in. My method is to have six or more combs of brood with bees to crowd the brood chamber, then I put ona super of combs to get the bees started above the brood chamber, and after they have clustered a few days in the super with honey coming in, the super with honey coming in, then take og the extra super and put on a queen excluder over the brood chamber, then add the comb honey super. Queen excluders are always used under the first super to prevent the queen from laying above. To put a strip of queen excluder over the entrance would prevent the old laying queen from going out with the swarm and would cause the swarm to return to the parent hive. The hatching virgins would kill the confined laying queen, and unless the virgin that survived was allowed her freedom from the entrance to the hive she and the colony would become worthless as she could not get out to be fertilized. Fertilization takes place in the air in flight. Would advise the inquirer to procure a good bee book as soon as possible.

itting Barley Hay

Please advise proper time to cut rley for hay.—Subscriber, Coachella.

It is usually cut in the early "milk" age. Some claim that higher feed lue is secured by allowing the hay get into the "dough" stage, but ıile this increases the feeding value the grain that of the straw is mater- lly lowered.

g Cartons

If the subscriber at Lemon Grove ıo wrote requesting information as egg cartons had signed his name e could have sent him the informa- ɔn desired.

alnut Huller

A subscriber wishes to know as to ethod of making a huller to remove e hulls which stick to English wal- ıts. The matter was referred to Mr. eff, and he writes: "Sometimes a ire covered drum 24 to 30 inches in ameter and four to eight feet long is ıed to hull walnuts. The drum is tated by some light power, and ater is run on the walnuts from a rforated pipe, this being kept up ıtil the hulls are worn off. Some of e drums have barbed wire arranged side so the walnuts will fall on the ires and assist in tearing the hulls, ıt none of these are very successful. he Maiers huller is the best as far as know, but the help we are able to get gather walnuts cannot be worked ɔnomically when anything requiring ıilled labor is used." Mr. Neff adds at he can furnish general directions r such huller to Cultivator readers desired.

hite Diarrhea

Please advise cause and method of eatment for white diarrhea in baby ıicks.—Subscriber, Los Olivos.

Mrs. Koethen's "Poultry for Profit" eats this trouble quite fully, but be- re giving treatment she makes es- ecially strong the point that "well ıtched, well bred chicks, kept warm ıd reasonably well fed" are reason- ɔly sure of escaping this trouble. verheating before hatching or chill- g after hatching is liable to cause ıe ordinary diarrhea. White diar- ıea is an infectious disease which ɜually comes from infected eggs laid ɣ an infected hen. The treatment ven in Mrs. Koethen's book is: When a chick is 'pasted up' the ɛcrement should be carefully re- ıoved and the vent greased with vase- ne. If faulty brooding is the cause emedy this at once and you may save ıe chick. Boiled rice with cinnamon nd scalded milk with a little grated utmeg instead of the regular diet re recommended, and sour milk or uttermilk are the best of remedies; ut a chick with real white diarrhea ill not eat much, so the treatment ıust be mainly preventive. Rettger nd Stoneburn give the following on reventing white diarrhea:

"Since the disease cannot apparent- ; be transmitted through the food upply after the chicks have reached he age of three or four days, every ıeans should be taken to prevent the pread of the infection during this ritical period. We suggest:

"The segregation of chicks in small ɔts during this interval.

"Perfect disinfection and clean- iness of brooders and brooder coops.

"Food and water supplied in such ıanner as to prevent contagion by the roppings.

"The use in the brooder of a liberal mount of fine, absorptive litter which vill quickly cover and seal up the roppings.

"Raise and maintain the vigor and ilality of the breeding stock and hicks by every reasonable means nown to the poultryman."

Ants

Please give method of control of arge and small black ants around the ɔase of fruit trees. They eat the buds ınd have killed three prune trees.—Subscriber, Highland.

This may be the Argentine ant. Would advise that some of the ants ɔe sent to Prof. C. W. Woodworth, University of California, Berkely, with request for information and a ɔulletin on the Argentine ant publish- ɜd by the university. Ordinary ants ɔo not destroy vegetation but often ive on the products of other insects. Ant destroyers which are advertised in the Cultivator will ordinarily succeed in driving them away. The liberal use of fresh buhach is also effective.

Re-Seeding Alfalfa

Last fall I seeded some land to alfalfa and about half a stand is the result today owing to the cold of the past winter. I dislike to lose all the plants that have started by plowing under, but wonder if I could get these plants up six or eight inches, cut, then go over the field with a disk drill and put the seed in an inch or so. Would the disk ruin the small plants?—Subscriber, Rosamond.

The disk drill will not injure the alfalfa roots after the plants have made a few inches of top growth but any re-seeding should be done before the weather gets very warm, or be left until the cool weather comes again. It is possible that with good irrigation the present stand will thicken and be sufficient without any more seed since a stand of plants which shows five plants to the square foot is ample for good crops. If the surface soil is well pulverized seed can be broadcast by hand on the thinnest places and harrowed without going over all the field. Any sowing that is done in dry, warm weather must be on very moist land and the land should be rolled to keep the moisture close to the surface until the plants are established.—J. B. N.

Broilers.

Do expert broiler raisers consider Rhode Island Reds develop faster into marketable broilers than do Plymouth Rocks, etc?—Subscriber, Nordhoff.

Both strain and management play a large part in the development of broilers. It is highly probable that some strains of Reds in expert hands can be brought to marketable weight earlier than some strains of Rocks in less expert hands, and there is little difference at the best, but I believe the Rock, take it by and large, has a little better reputation as a broiler bird. Broiler plants as a rule select either Orpington, Wyandotte or some variety of Rock, while the Rhode Island Red is without a rival as a general purpose fowl.—J. A. K.

The Lindsay-Strathmore irrigation ditch is almost completed. Twenty wells ranging in depth from 90 to 204 feet are ready for use.

P. S. C.

CONDENSED

Rosin Spray

is not a liquid

P. S. C. Rosin Spray contains Rosin, Fish Oil and Caustic. Easily dissolved—no boiling required. Will kill all varieties of scale on fruit trees. Nothing better known for Mealy Bug, Woolly Aphis, Black Peach Aphis and plant lice. One pound will make 2½ gallons of spray, full strength as specified by the Horticultural Commission of Los Angeles County.

Put up in following sizes:

1-lb. tin 25c, 2-lb. tin 40c, 4-lb. tin 75c. 40-lb. tin $4.00.

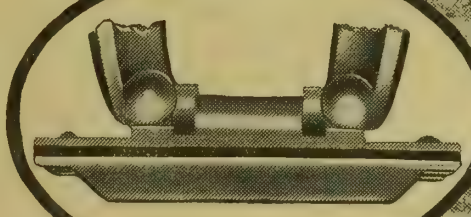
Prices in bulk on application.

Nurserymen save time and money by using P. S. C. Rosin Spray for dipping nursery stock. For sale at the best seed stores and nurseries. If your dealer cannot supply you order from the Western Wholesale Drug Co., Second and Los Angeles Street, Los Angeles, Cal.

Pacific Soap Company, Inc. LOS ANGELES

YUBA

Cross Section of Ball Tread



Traction!

The Yuba tread shoe is shaped to grip the ground — is made of cast high carbon steel to resist wear.

In loose soft soil the tread bites deep. It slips but little.

In sand it wears but slowly. The tread shoes are thickened at the point of wear.

In wet adobe the tread is self-cleaning.

On side hills it tends to run straight.

Yuba Manufacturing Company
433 California Street, San Francisco

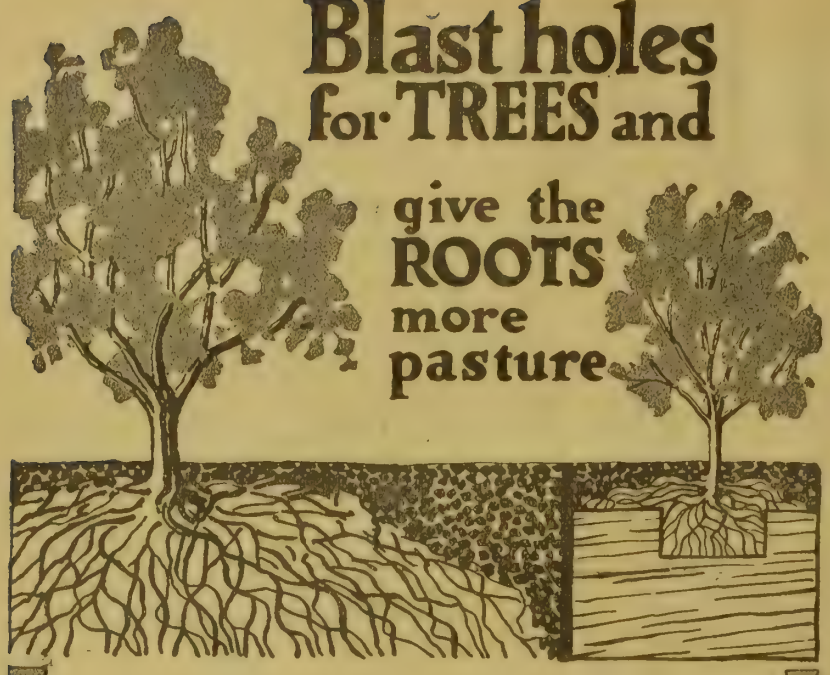
and there have just been issued new Pump and Plow Catalogs which we will be glad to send prospective buyers.

Blast holes for TREES and give the ROOTS more pasture



A tree in a blasted bed (at left) roots deeper, grows faster and bears earlier than a tree set in an ordinary dug hole (at right).

"The soil is the pasture in which the roots of the tree feed," says the Wyoming Experiment Station. "Blasting enlarges the root pasture, breaks up the hardpan and subsoil and permits the roots to go down and get plenty of food."

Plant your fruit trees in beds blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

—Eureka Stumping or Giant Stumping—which are made especially to meet Pacific Coast farm and orchard conditions. They pulverize the subsoil better than ordinary dynamites which often act too quickly and pack the earth.

Because the superiority of Giant Farm Powders is so generally acknowledged, other explosives are frequently offered as "giant powder." Insist upon having the genuine—always bearing the Giant brand.

Book "Better Orchard Tillage" Free

It tells and shows how to give your trees more pasture; how to blast for planting and how to increase the crops of bearing trees. Other books—on Stump Blasting, Boulder Blasting, Ditch Blasting and Subsoil Blasting for farm crops—are also sent free. Mark in the coupon the books that you prefer.

The American Sugar Beet Industry

SUGAR beet seed of good quality and in large quantities must be produced in the United States if the highest development of the beet sugar industry in this country is to be reached. The domestic beet sugar industry, in which more than $100,000,000 is now invested, was almost wholly dependent until the outbreak of the European war on a seed supply from Europe. The production from approximately 4,000 acres of beets was harvested in 1916, but this was hardly more than sufficient to plant the acreage of beets required by the natural expansion of the industry. In practically all instances the American-grown seed has been found superior to the imported seed. The chief reason for the dependence of America on the importation of seed in the past was the low price at which the supply could be obtained from abroad.

The studies of plant specialists of the department of agriculture lead them to believe that the quantity beet seed and of the crops which suc produce can be improved greatly b selection and plant breeding and th cost can be reduced. At present the are in this country no distinct types sugar beets. In many sugar beet fiel throughout the country, whatever th name of the so-called variety grow from six to 20 or more distinct typ of beets can be found.

The production of beet seed r quires two seasons of growth. Th mature beets resulting after or season from the seed must b harvested, the leaves removed an the roots carefully siloed with a di covering to preserve them in a do mant condition through the winte

These roots are planted at the ear est possible time the following sprin and rapidly produce seed stalks fro three to six feet in height. These a harvested with a sickle at the prop time and the seed carefully threshe cleaned and cured.

Tulare Will Grow Beans This Year

It having been proved that beans grow well in this part of the state, and because of the good prices they are bringing, many of the ranchers of the district to the west and south of Porterville are going into the business on an extensive scale this year. It is expected that the number of acres devoted to bean culture in this district will be increased from the 300 of last year to fully 1000, and that in course of time this district will rival the famous bean district of Ventura.

A great stimulus to the bean industry in this district has been the proposition of the Hoag-Kellog Company of Ventura to furnish the ranchers free seed to be returned at harvest time. The company will also send a thresher to handle the crop, the ranchers to pay for the threshing and to receive at th rate of five and a half cents a pou for the recleaned beans. A. O. Thom son of this district who has been e perimenting with beans for the pa three years, is acting as represent tive for the Ventura firm.

In his experiments Mr. Thomps planted beans every month in th year. He found the Tepary be suited to this district in that it is prolific bearer and does not bligh From the middle of April to the mi dle of June has proved the best plan ing time. Tepary beans in this di trict have been producing from 15 to 1800 pounds to the acre. Last ye Taggard Brothers took a $50 to th acre barley crop from a 50-acre fie after which they grew a $2200 be crop on the same land.—M. L. B.

Corn Growing

Corn will not grow during cold weather as will wheat and oats. Corn planting time is, therefore, a little later than the best time for sowing spring wheat or spring oats. However, according to Farmers' Bulletin 773, when seed of perfect vitality is used, it is remarkable how early in the spring corn can be planted and result in good stands and good yields. Seed of perfect vitality will often remain in cold or dry soils for several weeks and afterwards germinate and yield well. Irregular stands are sometimes attributed to poor seed, when dry, poorly prepared spots are the cause. Fields are sometimes seen in which the seed germinated promptly in moist spots but did not germinate in dry spots until rains came.

Where the seasons are long and moisture plentiful, it is customary to wait until the soil is warm before planting. In semiarid regions, however, corn should be planted early. With the soil in proper condition it is generally advisable in semiarid regions, south as well as north, to plant corn before danger from frost is entirely past. Corn planted very early usually makes a slow tough growth and a month after planting may be smaller and look less promising than that planted later. The early planted corn ripens first, however, and usually produces the larger or the better crop. Because of its slow, tough growth corn planted very early is not so susceptible to frost and drouth as corn planted later and grows more rapidly. In a series of years the gain in mature corn secured from early planting will more than make up for any injury from spring frosts. Excellent corn crops have been produced from plantings frozen off or frozen back when plants were from a few inches to a foot or more tall. Corn is not often entirely killed by spring frosts, and if some should be injured the loss is much less serious than that from summer drouth or from fall frost.

Early planted corn derives more benefit from the spring moisture supply, becomes well rooted before summer drouth begins, and may even mature before these drouths become s vere.

Where the growing season is ve long and warm, plantings made about 30-day intervals increase th chances of hitting the season right a raising some good corn.

ROAD TROUBLES IN DRY REGION
